Geometry by Its Transformations Christopher Baltus, 2025-02-07 This textbook combines the history of synthetic geometry centered on the years 1800 1855 with a theorem proof exposition of the geometry developed in those years The book starts with the background needed from Euclid s Elements followed by chapters on transformations including dilation similitude homology homogeneous coordinates projective geometry inversion the M bius transformation and transformation geometry as in French schoolbooks of 1910 Projective geometry is presented by tracing its path through

the work of J V Poncelet J Steiner and K G C von Staudt Extensive exercises are included many from the period studied The prerequisites for approaching this course are knowledge of high school geometry and enthusiasm for mathematical demonstration This textbook is ideal for a college geometry course for self study or as preparation for the study of modern geometry

The straight line and circle George Alexander Gibson, Paul Whittier Pinkerton, 1924 *The Physical and Mathematical Foundations of the Theory of Relativity* Antonio Romano, Mario Mango Furnari, 2019-09-25 This unique textbook offers a mathematically rigorous presentation of the theory of relativity emphasizing the need for a critical analysis of the foundations of general relativity in order to best study the theory and its implications The transitions from classical mechanics to special relativity and then to general relativity are explored in detail as well helping readers to gain a more profound and nuanced understanding of the theory as a whole After reviewing the fundamentals of differential geometry and classical mechanics the text introduces special relativity first using the physical approach proposed by Einstein and then via Minkowski's mathematical model The authors then address the relativistic thermodynamics of continua and electromagnetic fields in matter topics which are normally covered only very briefly in other treatments in the next two chapters The text then turns to a discussion of general relativity by means of the authors unique critical approach underlining the difficulty of recognizing the physical meaning of some statements such as the physical meaning of coordinates and the derivation of physical quantities from those of space time Chapters in this section cover the model of space time proposed by Schwarzschild black holes the Friedman equations and the different cosmological models they describe and the Fermi Walker derivative Well suited for graduate students in physics and mathematics who have a strong foundation in real analysis classical mechanics and general physics this textbook is appropriate for a variety of graduate level courses that cover topics in relativity Additionally it will interest physicists and other researchers who wish to further study the subtleties of these theories and understand the contemporary scholarly discussions surrounding them
