Human Reproduction

Human reproduction

Human reproduction is sexual reproduction involving male and female reproductive cells called gametes. The reproductive system includes organs called gonads that produce gametes and hormones; ducts for transport, storage and transportation of gametes; accessory organs and glands for fluid secretion; and internal genitalia. Reproduction is regulated by hormones produced by the gonads, the hypothalamus and the pituitary gland. Fertilisation involves the introduction of sperm into the vagina. The sperm travels through the female reproductive tract until it encounters an ovum, a female sex cell. Fertilisation can then take place.

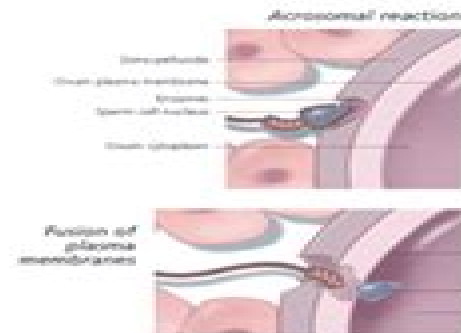

Male reproductive system

The adult male reproductive system is a part of the endocrine system. It consists of the testes, vas deferens, epididymis, urethra, and penis. The testes are divided into two halves, each containing a testis. The testes are located in the scrotum, a sac of skin and muscle that hangs below the penis. The testes are responsible for producing sperm and testosterone.

The testes are located in the scrotum, a sac of skin and muscle that hangs below the penis. The testes are responsible for producing sperm and testosterone.

Testosterone is produced within the testes by specialized cells known as Leydig cells. Testosterone is the main hormone responsible for maintaining the structure and function of the sex organs and promoting the development of male secondary sex characteristics.

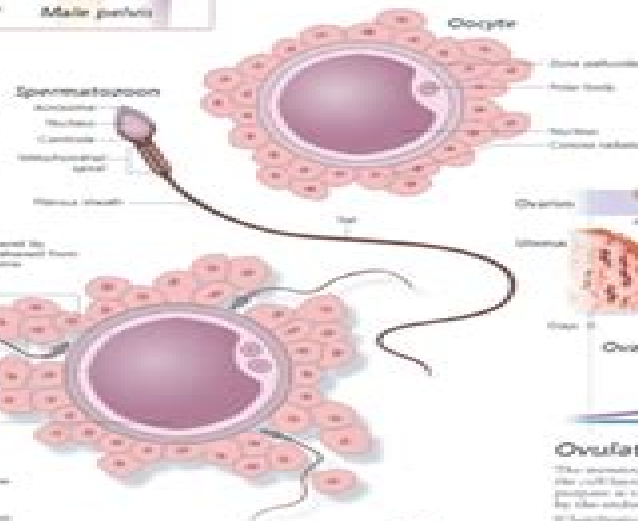

Fertilization

The upper portion of the vagina leads to the vaginal canal for fertilisation. Millions of sperm travel through the female reproductive tract, ultimately only one will fertilise the egg. Within a sperm, there is a nucleus containing the genetic material. The sperm travels through a path made by the digestive cells of the vagina. When the cell membrane of the egg and sperm come in contact, the membranes fuse, and the sperm nucleus and associated material enter into the egg. Other sperm are prevented from entering by a chemical change in the zona pellucida. The egg nucleus membrane dissolves the chromosomes of the egg and sperm combine, and a fertilised egg, or zygote, is formed. The change process starts with a nuclear division producing 2 identical cells called blastomeres.

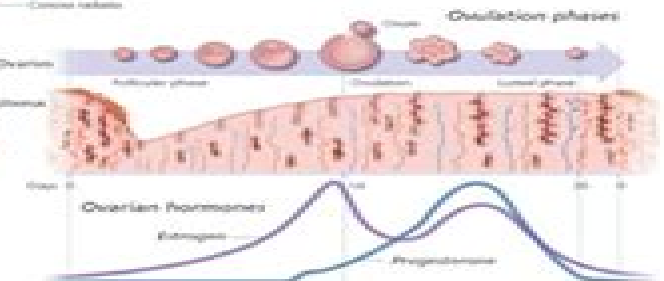

Female reproductive system

The internal anatomy of the adult female reproductive system includes the vagina, uterus, ovaries and fallopian tubes. These structures form a pathway allowing the release of an egg cell, fertilisation, its growth and delivery of a developed fetus. The vagina is a muscular canal that leads from the uterus to the outside of the body. It is the birth canal. The uterus is a hollow, pear-shaped organ with muscular walls that contract during childbirth. The ovaries are the female sex glands, which produce eggs during each menstrual cycle in preparation for implantation by a fertilised egg. The lining is shed during menstruation if fertilisation does not occur.

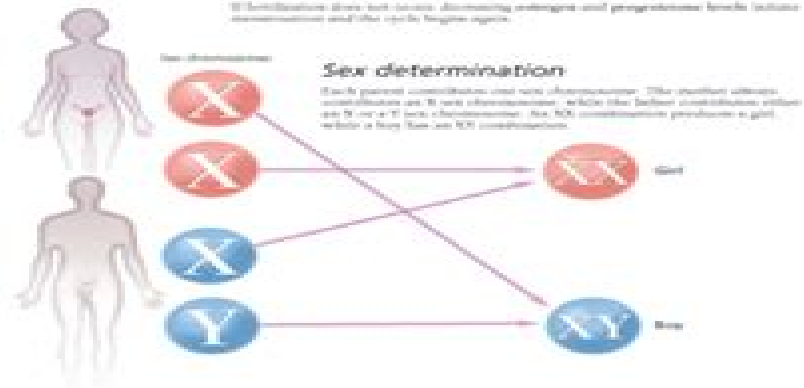

The ovaries, located on each side of the uterus, are responsible for producing eggs as well as the female sex hormones estrogen and progesterone. Estrogen is responsible for the development of the female reproductive structures, menstrual characteristics, and breast development. Progesterone prepares the uterus lining for implantation of a fertilised egg and is necessary for breast milk production. The ovaries are connected to the uterus by the fallopian tubes, narrow ducts that provide a passageway for the egg to reach the uterus.

Ovulation & the menstrual cycle

The menstrual cycle refers to the sequence of events that occurs in the endometrium, the cell lining lining the uterus. The cycle normally lasts approximately 28 days. The purpose is to prepare the uterus for possible pregnancy. The menstrual cycle is governed by the endocrine system. If fertilisation does not occur, decreasing estrogen and progesterone levels initiate menstruation and the cycle begins again.
