

## Cell Membrane Information Worksheet

### *Composition of the Cell Membrane & Functions*

The cell membrane is also called the **plasma membrane**. It is made of a phospholipid bilayer. This double layer of lipids is also known as a **fluid mosaic** because the phospholipids that make up the membrane lie next to each other but are not connected. This gives the cell membrane a fluid motion. The cell membrane is embedded with many different proteins and other substances that allow some selective materials to enter and leave the cell. The many different substances that are embedded in the cell membrane give it a look similar to a mosaic in the art world which uses pieces of tile to form a picture or design.

The phospholipids have a **polar, hydrophilic** (water attracting) head and two **nonpolar, hydrophobic** (water repelling) tails. Phospholipids can move from side to side and allow **water and other small molecules** to pass through into or out of the cell. Since the cell membrane is mostly made of lipids, only lipid soluble (meaning things that can dissolve in lipids) substances such as **oxygen** and **carbon dioxide** can pass through in this way. Other substances that are water soluble need to pass through openings created by different kinds of proteins which are inserted into the membrane. Water soluble substances include molecules like glucose, amino acids, ions and water.
