Engineering Mechanics Robert W. Soutas-Little, D. J. Inman, 1999 For courses in Dynamics State of the art in both perspective and approach this text puts the motion back into the presentation of dynamics Drawing on the power and widespread use of modern computational tools e.g. MathCAD MATLAB Mathematica and Maple it is written from the point of view that the systems of interest are in motion and focuses on solving the dynamics problems for general time and plotting and visualizing the response Text designed to be used in conjunction with a computational software package and an accompanying manual The manual includes all the examples from the text and key stroke instructions for the applicable tool and allows the student to compute solutions and to visualize physical properties Explains how to use the software to solve the problems in the text Features a unique pedagogical approach unlike the standard compute the acceleration at a single time or position approach taken by most other texts this text Treats dynamics as founded on Newton's laws which produce differential equations Presents the entire motion of particles and rigid bodies through the analytical or numerical solution of those equations Allows the v

The Publishers' Trade List Annual, 1981 **A Project-Based Introduction to Computational Statics** Andreas Öchsner, 2020-11-13 This book uses a novel concept to teach the finite element method applying it to solid mechanics This major conceptual shift takes away lengthy theoretical derivations in the face to face interactions with students and focuses on the summary of key equations and concepts and to practice these on well chosen example problems For this new 2nd edition many examples and design modifications have been added so that the learning by doing features of this book make it easier to understand the concepts and put them into practice The theoretical derivations are provided as additional reading and students must study and review the derivations in a self study approach The book provides the theoretical foundations to solve a comprehensive design project in tensile testing A classical clip on extensometer serves as the demonstrator on which to apply the provided concepts The major goal is to derive the calibration curve based on different approaches i.e. analytical mechanics and based on the finite element method and to consider further design questions such as technical drawings manufacturing and cost assessment Working with two concepts i.e. analytical and

computational mechanics strengthens the vertical integration of knowledge and allows the student to compare and understand the different concepts as well as highlighting the essential need for benchmarking any numerical result
