

Genetics Practice Problems: Pedigree Tables

Remember the following when working pedigree tables:

- 1) Circles are females and squares are males.
- 2) A shaded circle or square indicates that a person has the trait.

The pedigree seen below is the inheritance of a trait. Shaded individuals are affected. First, determine the probable genotype of person 1 = 11. Then answer the questions below the table.

What do you know about the genotype of the mother of II?

These parents (I) had an affected son (II). His dad is unaffected, but affected when he is mother. Since the mother is not shaded she must be a carrier.

Number II is shaded but the father is not shaded so he is not affected by color blindness.

Yes, he must be a carrier for color blindness. From his mother. Must have been there if color blindness. From their father.

Number number II and II were shaded. How many have color blindness (X)?

Both mother and father are carriers for color blindness.

What must be the genotype of the parents of a non-affected daughter? Explain.

To have an unaffected daughter, she must have the normal alleles from both parents. Her father must be $X^N Y$ and mother must have $X^N X^N$ or $X^N X^N$.

If number II has a normal son, what is the probability that their son will be colorblind?

$X^N X^N \times X^N Y \rightarrow$ all of their sons will not be colorblind.
