Crafting Science Joan H. Fujimura, 1996

During the late 1970s and 1980s cancer underwent a remarkable transformation. In one short decade what had long been a set of heterogeneous diseases marked by uncontrolled cell growth became a disease of our genes. How this happened and what it means is the story Joan Fujimura tells in a rare inside look at the way science works and knowledge is created. A dramatic study of a new species of scientific revolution, this book combines a detailed ethnography of scientific thought, an in-depth account of science practiced and produced, a history of one branch of science as it entered the limelight, and a view of the impact of new genetic technologies on science and society. The scientific enterprise that Fujimura unfolds for us is proto-oncogene cancer research: the study of those segments of DNA now thought to make normal cells cancerous. Within this framework she describes the processes of knowledge construction as a social enterprise, an endless series of negotiations in which theories, material technologies, and practices are co-constructed, incorporated, and refashioned. Along the way, Fujimura addresses long-standing questions in the history and philosophy of science, culture theory, and sociology of science. How do scientists create good problems, experiments, and solutions? What are the cultural, institutional, and material technologies that have to be in place for new truths and new practices to succeed? Portraying the development of knowledge as a multidimensional process conducted through multiple cultures, institutions, actors, objects, and practices, this book disrupts divisions among sociology, history, anthropology, and the philosophy of science, technology, and medicine.

Genetics

Manual G. P. Rēdei, 1998. Redei has created an outstanding compendium of genetics. Arranged as a dictionary, the book is almost an encyclopedic collection of terms and concepts. The author has managed to define terms with appropriate mixtures of depth and detail for the researcher, along with clarity useful for the nonexpert. Choice 1998.

The Laboratory Mouse

Hans Hedrich, 2004-08-21. Among animals used in research, teaching, and testing, mice are now widely recognized as the most important model for human diseases and disorders. They comprise the majority of all experimental mammals and tend to be the model of choice used for research into many diseases and disorders, including cancer, heart disease, asthma, Alzheimer's, Down syndrome, deafness, osteoporosis, obesity, diabetes, and even mental health research. Additionally, the laboratory mouse continues to play a widely publicized vital role in the human genome project. One of the most time-consuming activities in research laboratories is looking up information specific to the species or strain of animal being used. This book, part of the highly successful Handbook of Experimental Animals series, allows the user quick access to any point of interest on the mouse as an experimental model. Edited by Hans Hedrich, Hannover Medical School. Comprehensive reference source written by international experts. Well illustrated with high quality, detailed images. Two-color, user-friendly format combined with color plate sections.
