

# ENDOCRINE SYSTEM

## Endocrine System: WORKING TOGETHER

Each organ system works on other systems within the body to do its "job". Our bodies learn just some of the ways that the endocrine system interacts with other organ systems.

### Nervous System

### Circulatory System

## Endocrine System: FACTS

## Endocrine System: PROBLEMS

Most of the time, the endocrine system works perfectly well. However, sometimes problems can arise.

### Diabetes

Diabetes is a condition that causes high blood glucose (sugar) levels. It is caused by the body being unable to either produce or use the hormone insulin. So, the glucose (sugar) gets stuck in the blood. Symptoms include increased thirst, weight loss, frequent urination, blurred vision, slow wound healing, and frequent weight changes, persistent acne, rashes, or itching in the hands.

## Endocrine System: KEY TERMS

Term	Definition
Endocrine System	Network of endocrine glands that make, store, and release hormones.
Hormones	Chemical messengers that carry information and instructions from one cell to another.

## Endocrine System: HORMONES

Hormones are chemical signals. Hormones are released into the bloodstream by endocrine glands. They travel through the bloodstream and bind to target cells, which then respond to the signal. Hormones can affect many different parts of the body, such as growth, metabolism, and reproduction.

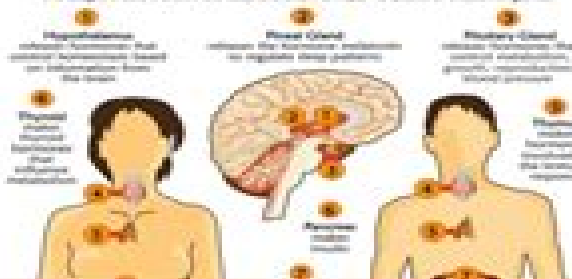

## Endocrine System: FIGHT-OR-FLIGHT

The fight-or-flight response is a reaction that occurs in the body when we are really frightened. The body's fight-or-flight response is the body's way of reacting to a dangerous situation. When we feel scared, our body releases hormones that help us react quickly. These hormones increase our heart rate, blood pressure, and breathing rate. They also make us feel alert and ready to react. The fight-or-flight response is a natural reaction that helps us survive in dangerous situations.

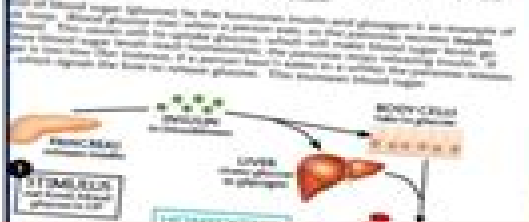

## Endocrine System: GLANDS

A gland is a structure that produces and releases substances that perform a specific function in the body. There are many different types of glands in the body. Some glands release hormones, while others release enzymes or other substances. Glands are part of the endocrine system, which is responsible for producing and releasing hormones.

## Endocrine System: FEEDBACK LOOPS

Endocrine activities are regulated by complex feedback loops. These feedback loops help the body maintain balance. When a hormone level is too high or too low, the body releases a signal that tells the gland to stop or start producing the hormone. This signal is called a feedback loop. The feedback loop helps the body maintain balance by keeping hormone levels within a certain range.
