

ENDOCRINE SYSTEM

Endocrine System: WORKING TOGETHER

Each organ system works on other systems within the body to do its "job". See below to learn just some of the ways that the endocrine system interacts with other organ systems.

Nervous System

Circulatory System

Endocrine System: FACTS

Endocrine System: PROBLEMS

Most of the time, the endocrine system works perfectly well. However, sometimes problems can arise.

Diabetes

Diabetes is a condition that causes high blood glucose (sugar) levels. It is caused by the body being unable to either produce or use the hormone insulin. So, the glucose (sugar) gets stuck in the blood. Symptoms include increased thirst, weight loss, frequent urination, blurred vision, slow wound healing, and frequent weight changes, persistent acne, rashes, or itching in the hands.

Endocrine System: KEY TERMS

Term	Definition
Endocrine System	Network of endocrine glands that make, store, and release hormones.
Hormones	Chemical messengers that carry information and instructions from one cell to another.

Endocrine System: HORMONES

Hormones are chemical signals. Hormones are released by a gland into the bloodstream. They travel through the bloodstream and bind to that specific target cell. The target cell then produces a response. Hormones can be made by the endocrine system or by other parts of the body.

Endocrine System: FIGHT-OR-FLIGHT

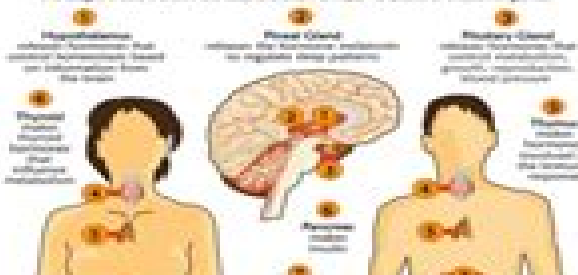

The fight-or-flight response is a reaction that occurs in the body when we are really frightened. The brain (specifically the hypothalamus) tells our adrenal glands to fight the danger. The adrenal glands release hormones that make us feel like we are in danger. These hormones make us feel like we are in danger. They also make us feel like we are in danger. They also make us feel like we are in danger.

So, when we are really frightened, our adrenal glands release hormones that make us feel like we are in danger. These hormones make us feel like we are in danger. They also make us feel like we are in danger. They also make us feel like we are in danger.

Endocrine System: GLANDS

A gland is a structure that produces and releases substances that perform a specific function in the body. There are many types of glands in the body. Some glands are endocrine glands, which release hormones into the bloodstream. Other glands are exocrine glands, which release substances into the body through a duct. Endocrine glands include the hypothalamus, pituitary, thyroid, parathyroid, adrenal, and pancreas.

Endocrine System: FEEDBACK LOOPS

Endocrine systems are regulated by complex feedback loops. These feedback loops help the body maintain a stable internal environment. When a hormone level is too high or too low, the body releases a signal to the endocrine system to adjust the hormone level. This signal is called a feedback loop.

There are two types of feedback loops: negative and positive. Negative feedback loops are the most common. They help the body maintain a stable internal environment. Positive feedback loops are less common. They help the body respond to a stimulus.

For example, when a person's blood sugar is too low, the pancreas releases insulin. Insulin helps the body use glucose for energy. This lowers the blood sugar level. This is a negative feedback loop.
