Algorithms for VLSI Physical Design Automation Naveed A. Sherwani, 2013-06-29 Algorithms for VLSI Physical Design Automation is a core reference text for graduate students and CAD professionals It provides a comprehensive treatment of the principles and algorithms of VLSI physical design Algorithms for VLSI Physical Design Automation presents the concepts and algorithms in an intuitive manner Each chapter contains 3 4 algorithms that are discussed in detail Additional algorithms are presented in a somewhat shorter format References to advanced algorithms are presented at the end of each chapter Algorithms for VLSI Physical Design Automation covers all aspects of physical design The first three chapters provide the background material while the subsequent chapters focus on each phase of the physical design cycle In addition newer topics like physical design automation of FPGAs and MCMs have been included The author provides an extensive bibliography which is useful for finding advanced material on a topic Algorithms for VLSI Physical Design Automation is an invaluable reference for professionals in layout design automation and physical design The Electronic Design Automation Handbook Dirk Jansen, 2010-02-23 When I attended college we studied vacuum tubes in our junior year At that time an average radio had ve vacuum tubes and better ones even seven Then transistors appeared in 1960s A good radio was judged to be one with more thententransistors Latergoodradioshad15 20transistors and after that everyone stopped counting transistors Today

modern processors running personal computers have over 10 million transistors and more millions will be added every year. The difference between 20 and 20M is in complexity methodology and business models. Designs with 20 transistors are easily generated by design engineers without any tools whilst designs with 20M transistors can not be done by humans in reasonable time without the help of Prof Dr Gajski demonstrates the Y chart automation. This difference in complexity introduced a paradigm shift which required sophisticated methods and tools and introduced design automation into design practice. By the decomposition of the design process into many tasks and abstraction levels the methodology of designing chips or systems has also evolved. Similarly the business model has changed from vertical integration in which one company did all the tasks from product specification to manufacturing to globally distributed client server production in which most of the design and manufacturing tasks are outsourced.
