

to maintain a comfortable environment inside the house. By analyzing the heat transfer and air flow, we learn what heat transfer (and air flow) is required for the house to be comfortable. A thermodynamic analysis will tell us the conditions needed to maintain the temperature and relative humidity, and that analysis will tell us the size of the fan required to push the air in, the conditioner and the ducts needed to distribute the cooled air throughout the house.

Perhaps we want to focus on the air conditioner itself. Figure 1.2 is a schematic of two heat exchangers, a compressor, and a valve. A thermodynamic analysis would tell us how much refrigerant, what a second aspect of cooling. A heat transfer analysis would tell us the heat exchangers. The fluid dynamics analysis would tell us the cooling of the compressor itself, as well as the ducts needed to connect the

the compressor itself, maintain a cooling system itself a compressor (Figure 1.3). The compressor itself and power supply must be cooled so that the reliability of the system is not compromised. This involves cooling approaches as to how air through the compressor case to remove unwanted heat. A thermodynamic analysis of each case, power supply, and compressor as well as the amount of energy that could be removed from inside the compressor case so that the temperature of the air entering the compressor will not exceed a given limit. That transfer analysis will tell us what heat sink design, fan, or other cooling strategies are needed to maintain the components at a safe temperature. Fluid dynamics will tell us the fan size needed to push air through the air filter and then the air out of the compressor and out of the compressor case.

1.2 THERMAL AND FLUID SYSTEMS ANALYSIS AND ENGINEERING

Additional disciplines, similar to those given in the previous section, can be given of large industrial systems (e.g., power plants, oil refineries, chemical processing plants) and related processes (e.g., heat treatment of metals). Heat propagation that would otherwise have thermodynamics, heat transfer, and fluid dynamics are all needed in many design fields. It is the integrated use of these three disciplines that is required for rational and complete analysis of many systems.

Whether the engineer is given an assignment to design a new device or modification to an existing process or to predict the performance of a device, the objectives of the design process must be very clear. Subsequent, which aspect of the device, process, or system in which to focus must be well defined. A systematic approach to the design analysis is needed. Figure 1.4 shows a flow diagram of the design process typically take when analyzing and engineering a device or process. We always begin with the physical system (e.g., the engine of a car). This is reality. The engineer's job is, first, to translate the physical reality into a physical model and, second, to describe the physical model with a mathematical model. The actual physical system may be so complex that it is impossible to fully describe each part within process. However, we require that device as a model, a picture, or picture that we can describe and represent in depth by the system sufficiently so that it can be modeled. Once a physical model is developed, then physical laws that govern the process (e.g., a force, momentum, mass, or energy balance) are used to create the
