Transplant Rejection and Tolerance: Advancing the Field through Integration of Computational and Experimental Investigations

Giorgio Raimondi, Kathryn J. Wood, Alan S. Perelson, Julia C. Arciero, 2017-12-15 Organ transplantation is a life saving surgical procedure through which the functionality of a failing organ system can be restored However without the life long administration of immunosuppressive drugs the recipient s immune system will launch a massive immune attack that will ultimately destroy the graft Although successful at protecting the graft from an immune attack long term use of immunosuppressive drugs leads to serious complications e g increased risk of infection diabetes hypertension cardiovascular disease and cancer Moreover recipients suffer from limited long term graft survival rates due to the inability of current treatments to establish tolerance to the transplanted tissues Thus there is a great medical need to understand the complex network of immune system interactions that lead to transplant rejection so that new strategies of intervention can be determined that will redirect the system toward transplant acceptance while preserving immune competence against offending agents In the past 20 years the discovery and growing understanding of the positive and negative regulators of the activation of the immune system have fostered new interventional procedures targeting one or the other While pre clinical results proved the validity of these strategies their clinical implementation has been troublesome These results underscore the need for additional methods to determine the most effective interventions to prevent long term transplant rejection New tools of genomics proteomics and metabolomics are being implemented in powerful analyses that promise the development of better safer personalized treatments In parallel theoretical modeling has emerged as a tool that transcends investigations of individual mechanistic processes and instead unravels the relevant mechanisms of complex systems such as the immune response triggered by a transplant In this way theoretical models can be used to identify important behavior that arises from complex systems and thereby delineate emergent properties of biological systems that could not be identified studying single components Employing this approach interdisciplinary collaborations among immunologists mathematicians and system biologists will yield novel perspectives in the development of more effective strategies of intervention The aim of this Research Topic is to demonstrate how new insight and methods from theoretical and experimental studies of the immune response can aid in identifying new research

directions in transplant immunology First techniques from various theoretical and experimental studies with applications to the immune response will be reviewed to determine how they can be adapted to explore the complexity of transplant rejection Second recent advances in the acquisition and mining of large data sets related to transplant genomics proteomics and metabolomics will be discussed in the context of their predictive power and potential for optimizing and personalizing patient treatment Last new perspectives will be offered on the integration of computational immune modeling with transplant and omics data to establish more effective strategies of intervention that promote transplant tolerance **Software**

Groundwater Engineering Jacques W. Delleur,2010-12-12 Due to the increasing demand for adequate water supply caused by the augmenting global population groundwater production has acquired a new importance In many areas surface waters are not available in sufficient quantity or quality Thus an increasing demand for groundwater has resulted However the residence of time of groundwater can be of the order of thousands of years while surface waters is of the order of days Therefore substantially more attention is warranted for transport processes and pollution remediation in groundwater than for surface waters Similarly pollution remediation problems in groundwater are generally complex This excellent timely resource covers the field of groundwater from an engineering perspective comprehensively addressing the range of subjects related to subsurface hydrology It provides a practical treatment of the flow of groundwater the transport of substances the construction of wells and well fields the production of groundwater and site characterization and remediation of groundwater pollution No other reference specializes in groundwater engineering to such a broad range of subjects Its use extends to The

engineer designing a well or well field The engineer designing or operating a landfill facility for municipal or hazardous wastes The hydrogeologist investigating a contaminant plume The engineer examining the remediation of a groundwater pollution problem The engineer or lawyer studying the laws and regulations related to groundwater quality The scientist analyzing the mechanics of solute transport The geohydrologist assessing the regional modeling of aquifers The geophysicist determining the characterization of an aquifer The cartographer mapping aquifer characteristics The practitioner planning a monitoring network
