1. Model 2 illustrates three major processes which naturally occur:
  - a. **Carbon**
  - b. Natural land sinks that remove, resulting in less  $\text{CO}_2$  in the atmosphere
  - c. **Plant, organisms and animals:**
  - d. Photosynthesis and the absorption of  $\text{CO}_2$  from the atmosphere:
    - i. Labeled C in the diagram is Model 2 left to the right of the process
    - ii. **Photosynthesis**
    - iii. Natural organisms remove  $\text{CO}_2$  from the atmosphere
  - e. **Organisms**
  - f. Natural land sinks or organisms remove  $\text{CO}_2$  from the atmosphere:
    - i. Natural organisms or the land sinks are the process
    - ii. **Organisms**
    - iii. Natural land sinks or organisms remove  $\text{CO}_2$  from the atmosphere

It is almost impossible to find any natural land sinks or animals.

The Global Carbon Cycle and the Evolution of Photosynthesis Alexander A. Ivlev, 2019-11-05 The book deals with the problem of the interaction and interconditionality of the various processes occurring in both the Earth's crust and the biosphere It proposes a model of the global carbon cycle explaining the nature and mechanism of these interactions showing that the key element of this interaction is the photosynthesis controlled by periodic carbon dioxide injections caused by collision zones of lithospheric plates Changes in the environment due to the evolution of photosynthesis cause alterations in the carbon cycle and lead to a stationary state when new features of the cycle are manifested The main instruments of the analysis here are the isotopic technique and physico chemical modeling conducted on the basis of the principle of actualism The model provides explanations of periodic mass extinctions of organisms the explosions of life the uneven distribution of organic matter in the sedimentary strata stratigraphic oil distribution and various other events in the biosphere in the course of geological history The book will appeal to geologists geochemists climatologists ecologists biologists and specialists in global change

*The Changing Carbon Cycle* John R. Trabalka, David E. Reichle, 2013-03-09 The United States Government cognizant of its responsibilities to future generations has been sponsoring research for nine years into the causes effects and potential impacts of increased concentrations of carbon dioxide CO<sub>2</sub> in the atmosphere Agencies such as the National Science Foundation National Oceanic and Atmospheric Administration and the U S Department of Energy DOE cooperatively spent about 100 million from FY 1978 through FY 1984 directly on the study of CO<sub>2</sub> The DOE as the 2 lead government agency for coordinating the government's research efforts has been responsible for about 60% of these research efforts William James succinctly defined our purpose when he stated science must be based upon irreducible and stubborn facts Scientific knowledge can and will reduce the present significant uncertainty surrounding our understanding of the causes effects and potential impacts of increasing atmospheric CO<sub>2</sub> We have come far during the past seven years in resolving some underlying doubts and in narrowing the ranges of disagreement Basic concepts have become less murky Yet much more must be accomplished more irreducible and stubborn facts are needed to reduce the uncertainties so that we can improve our knowledge base Uncertainty can never be reduced to zero However with

The term carbon cycle is normally thought to mean those processes that govern the present day transfer of carbon between life the atmosphere and the oceans This book describes another carbon cycle one which operates over millions of years and involves the transfer of carbon between rocks and the combination of life the atmosphere and the oceans The weathering of silicate and carbonate rocks and ancient sedimentary organic matter including recent large scale human induced burning of fossil fuels the burial of organic matter and carbonate minerals in sediments and volcanic degassing of carbon dioxide contribute to this cycle In The Phanerozoic Carbon Cycle Robert Berner shows how carbon cycle models can be used to calculate levels of atmospheric CO<sub>2</sub> and O<sub>2</sub> over Phanerozoic time the past 550 million years and how results compare with independent methods His analysis has implications for such disparate subjects as the evolution of land plants the presence of giant ancient insects the role of tectonics in paleoclimate and the current debate over global warming and greenhouse gases
