## Endocrine System: WORKING TOGETHER

Each organ system works on other systems within the body to do its "job". See below to learn just some of the ways that the endocrine system interacts with other organ systems.

### Nervous System

### Circulatory System

## Endocrine System: FACTS

## Endocrine System: PROBLEMS

Most of the time, the endocrine system works perfectly well. However, sometimes problems can arise.

### Diabetes

Diabetes is a condition that causes high blood glucose (sugar) levels. It is caused by the body being unable to either produce or use the hormone insulin. So, the glucose (sugar) gets stuck in the blood. Symptoms include increased thirst, weight gain, changes in vision, increased weight changes, persistent sores, numbness or tingling in the hands.

## Endocrine System: KEY TERMS

Term	Definition
Endocrine System	Network of endocrine glands that make, store, and release hormones.
Hormones	Chemical messengers that carry information and instructions from one cell to another.

## Endocrine System: FUNCTIONS

The endocrine system is a network of glands that produce hormones. Hormones are the body's chemical messengers that carry information and instructions from one cell to another. Hormones control many, many important processes in our bodies.

### Function of the Endocrine System

## Endocrine System: HORMONES

Hormones are chemical signals. Hormones are released by a gland and travel in the blood to a receptor that binds and binds to that specific hormone. This binds a series of molecules that release chemical messengers. This causes an effect on the body.

## Endocrine System: FIGHT-OR-FLIGHT

The fight-or-flight response is a reaction that occurs in the body when we are really frightened. The body's fight-or-flight response is the body's way of reacting to a dangerous situation. When we feel scared, our body's fight-or-flight response is triggered. This causes our body to react in a way that helps us survive. The fight-or-flight response is a survival mechanism. Today, we do not usually have to fight or run away from a lion or a bear. But our body's fight-or-flight response is still there. It is a reaction that occurs in the body when we are really frightened. The body's fight-or-flight response is the body's way of reacting to a dangerous situation. ## Endocrine System: GLANDS

A gland is a structure that produces and releases substances that perform a specific function in the body. There are many glands in the body. Some glands are endocrine glands, which release hormones into the bloodstream. Other glands are exocrine glands, which release substances into the body through a duct. Endocrine glands include the hypothalamus, pituitary gland, thyroid gland, parathyroid glands, adrenal glands, and the pancreas.

## Endocrine System: FEEDBACK LOOPS

Endocrine activities are regulated by complex feedback loops. These feedback loops help the body maintain a balance of hormones. When a hormone level is too high or too low, the body's feedback loop triggers a response to bring the level back to normal. This is called a feedback loop. The feedback loop is a process that helps the body maintain a balance of hormones. When a hormone level is too high or too low, the body's feedback loop triggers a response to bring the level back to normal. This is called a feedback loop.

The glands react to hormonal changes in the blood in the same way. The glands only release enough hormone to bring the level back to normal. If the level is still too high or too low, the glands will release more hormone. This is called a feedback loop. The feedback loop is a process that helps the body maintain a balance of hormones. When a hormone level is too high or too low, the body's feedback loop triggers a response to bring the level back to normal. This is called a feedback loop.

Not all blood sugar is affected by the hormones insulin and glucagon. In an example of a feedback loop, the pancreas releases insulin when a person's blood sugar is too high. Insulin makes the body's cells take up more glucose from the blood. This lowers the blood sugar level. The pancreas also releases glucagon when a person's blood sugar is too low. Glucagon makes the liver release more glucose into the blood. This raises the blood sugar level. This is called a feedback loop.
