Fringe 2009 Wolfgang Osten, Malgorzata Kujawinska, 2010-04-28 21 years ago it was a joint idea with Hans Rottenkolber to organize a workshop dedicated to the discussion of the latest results in the automatic processing of fringe patterns This idea was promoted by the insight that automatic and high precision phase measurement techniques will play a key role in all future industrial and scientific applications of optical metrology A couple of months later more than 50 specialists from East and West met in East Berlin the capital of the former GDR to spend 3 days with the discussion of new principles of fringe processing In the stimulating atmosphere the idea was born to repeat the workshop and to organize the meeting in an olympic schedule And thus meanwhile 20 years have been passed and we have today Fringe number six However such a workshop takes place in a dynamic environment Therefore the main topics of the previous events were always adapted to the most interesting subjects of the new period In 1993 the workshop took place in Bremen and was dedicated to new principles of optical shape measurement setup calibration phase unwrapping and nondestructive testing while in 1997 new approaches in multi sensor metrology active measurement strategies and hybrid processing technologies played a central role 2001 the first meeting in the 21st century was focused to optical methods for micromasurements hybrid measurement technologies and new sensor solutions for industrial inspection

A New Boundary Element Formulation in Engineering Tania G.B. DeFigueiredo,2013-03-12 1 1 The Hybrid Displacement Boundary Element Model This work is concerned with the derivation of a numerical model for the solution of boundary value problems in potential theory and linear

elasticity It is considered a boundary element model because the final integral equation involves some boundary integrals whose evaluation requires a boundary discretization Furthermore all the unknowns are boundary variables The model is completely new it differs from the classical boundary element formulation in the way it is generated and consequently in the final equations A generalized variational principle is used as a basis for its derivation whereas the conventional boundary element formulation is based on Green's formula potential problems and on Somigliana's identity elasticity or alternatively through the weighted residual technique 2 The multi field variational principle which generates the formulation involves three independent variables For potential problems these are the potential in the domain and the potential and its normal derivative on the boundary In the case of elasticity these variables are displacements in the domain and displacements and tractions on the boundary For this reason by analogy with the assumed displacement hybrid finite element model initially proposed by Tong 1 in 1970 it can be called a hybrid displacement model The final system of equations to be solved is similar to that found in a stiffness formulation The stiffness matrix for this model is symmetric and can be evaluated by only performing integrations along the boundary
