Introductory Statistics with Applications in General Insurance I.

B. Hossack, J. H. Pollard, B. Zehnwrith, 1999-04 This is a new edition of a very successful introduction to statistical methods for general insurance practitioners. No prior statistical knowledge is assumed and the mathematical level required is approximately equivalent to school mathematics. Whilst the book is primarily introductory, the authors discuss some more advanced topics including simulation, calculation of risk premiums, credibility theory, estimation of outstanding claim provisions and risk theory. All topics are illustrated by examples drawn from general insurance and references for further reading are given. Solutions to most of the exercises are included. For the new edition, the opportunity has been taken to make minor improvements and corrections throughout the text, to rewrite some sections to improve clarity and to update the examples and references. A new section dealing with estimation has also been added.

Artificial Neural Nets and Genetic Algorithms David W. Pearson, Nigel C. Steele, Rudolf F. Albrecht, 2012-12-06

Artificial neural networks and genetic algorithms both are areas of research which have their origins in mathematical models constructed in order to gain understanding of important natural processes. By focussing on the process models rather than the processes themselves, significant new computational techniques have evolved which have found application in a large number of diverse fields. This diversity is reflected in the topics which are subjects of the contributions to this volume. There are contributions reporting successful applications of the technology to the solution of industrial commercial problems. This may well reflect the maturity of the technology, notably in the sense that real users of modelling prediction techniques are prepared to accept neural networks as a valid paradigm. Theoretical issues also receive attention, notably in connection with the radial basis function neural network. Contributions in the field of genetic algorithms reflect the wide range of current applications, including for example portfolio selection, filter design, frequency assignment, tuning of nonlinear PID controllers. These techniques are also used extensively for combinatorial optimisation problems.
