Computational Intelligence in Systems and Control Design and Applications S.G. Tzafestas,2000-01-31 This book contains thirty timely contributions in the emerging field of Computational Intelligence CI with reference to system control design and applications The three basic constituents of CI are neural networks NNs fuzzy logic FL I fuzzy reasoning FR and genetic algorithms GAs NNs mimic the distributed functioning of the human brain and consist of many rather simple building elements called artificial neurons which are controlled by adaptive parameters and are able to incorporate via learning the knowledge provided by the environment and thus respond intelligently to new stimuli Fuzzy logic FL provides the means to build systems that can reason linguistically under uncertainty like the human experts common sense reasoning Both NNs and FL I FR are among the most widely used tools for modeling unknown systems with nonlinear behavior FL suits better when there is some kind of knowledge about the system such as for example the linguistic information of a human expert On the other hand NNs possess unique learning and generalization capabilities that allow the user to construct very accurate models of nonlinear systems simply using input output data GAs offer an interesting set of generic tools for systematic random search optimization following the mechanisms of natural genetics In hybrid Computational Intelligence based systems these three tools NNs FL GAs are combined in several synergetic ways producing integrated tools with enhanced learning generalization universal approximation reasoning and optimization abilities

Nonlinear H2/H-Infinity Constrained Feedback Control Murad Abu-Khalaf, Jie Huang, Frank L. Lewis, 2006-08-02 The series Advances in Industrial Control aims to report and encourage technology transfer in control engineering The rapid development of control technology has an impact on all areas of the control discipline New theory new controllers actuators sensors new industrial processes computer methods new applications new philosophies new challenges Much of this development work resides in industrial reports feasibility study papers and the reports of advanced collaborative projects The series offers an opportunity for researchers to present an extended exposition of such new work in all aspects of industrial control for wider and rapid dissemination Almost all physical systems are nonlinear and the success of linear control techniques depends on the extent of the nonlinear system behaviour and the careful attention given to switching linear controllers through the range of nonlinear system operations In many industrial and process control applications good engineering practice linear control systems and classical PID control can give satisfactory performance because the process nonlinearity is mild and the control system performance specification is not particularly demanding however there are other industrial system applications where the requirement for high performance control can only be achieved if nonlinear control design techniques are used Thus in some industrial and technological domains there is a strong justification for more applications of nonlinear methods One prevailing difficulty with nonlinear control methods is that they are not so easily understood nor are they easy to reduce to formulaic algorithms for routine application
