The Myth of the Spoiled Child Alfie Kohn, 2016-03-08 A prominent and esteemed critic challenges widely held beliefs about children and parenting revealing that underlying each myth is a deeply conservative ideology that is ironically often adopted by liberal parents Somehow a set of deeply conservative assumptions about children what they re like and how they should be raised has congealed into the conventional wisdom in our society Parents are accused of being both permissive and overprotective unwilling to set limits and afraid to let their kids fail Alfie Kohn systematically debunks these beliefs not only challenging erroneous factual claims but also exposing the troubling ideology that underlies them Complaints about pushover parents and coddled kids are hardly new he shows and there is no evidence that either phenomenon is especially widespread today let alone more common than in previous generations Moreover new research reveals that helicopter parenting is quite rare and surprisingly may do more good than harm when it does occur The major threat to healthy child development Kohn argues is parenting that is too controlling rather than too indulgent With the same lively contrarian style that marked his influential books about rewards competition and education Kohn relies on a vast collection of social science data as well as

on logic and humor to challenge assertions that appear with numbing regularity in the popular press and are often accepted uncritically even by people who are politically liberal These include claims that young people suffer from inflated self esteem are entitled and narcissistic receive trophies praise and As too easily are in need of more self discipline and grit Kohn s invitation to reexamine these and other assumptions is particularly timely his book has the potential to change our culture s conversation about kids and the people who raise them

Essential Pathways and Circuits of Autism Pathogenesis Gül Dölen,Mustafa Sahin,2016-08-15 The Centers for Disease Control and Prevention estimate that 1 in 68 children in the United states is afflicted with autism spectrum disorders ASD yet at this time there is no cure for the disease Autism is characterized by delays in the development of many basic skills most notably the ability to

socialize and adapt to novelty The condition is typically identified in children around 3 years of age however the high heritability of autism suggests that the disease process begins at conception The identification of over 500 ASD risk genes has enabled the molecular genetic dissection of the pathogenesis of the disease in model organisms such as mice Despite the genetic heterogeneity of ASD etiology converging evidence suggests that these disparate genetic lesions may result in the disruption of a limited number of key biochemical pathways or circuits Classification of patients into groups by pathogenic rather than etiological categories will likely aid future therapeutic development and clinical trials In this set of papers we explore the existing evidence supporting this view Specifically we focus on biochemical cascades such as mTOR and ERK signaling the mRNA network bound by FMRP and UBE3A dorsal and ventral striatal circuits cerebellar circuits hypothalamic projections as well as prefrontal and anterior cingulate cortical circuits Special attention will be given to studies that demonstrate the necessity and or sufficiency of genetic disruptions e g by molecular deletion and or replacement in these pathways and circuits for producing characteristic behavioral features of autism Necessarily these papers will be heavily weighted towards basic mechanisms elucidated in animal models but may also include investigations in patients

Spitzer, 2015-09-16 Cyclic nucleotides control a number of neuronal properties including neuronal differentiation pathfinding regulation of excitability and synaptic transmission and control of gene expression Signaling events mediated by cAMP or cGMP are transient and take place within the complex 3 dimensional structure of the neuronal cell Signaling events happen

on the time scale of seconds to minutes and the biological significance of the temporal dimension remains poorly understood Structural features of neurons dendritic spines and branches cell body nucleus axon as well as AKAPs and other scaffolding proteins that keep signaling enzymes together and form signaling microdomains are critical spatial determinants of signal integration Finally the types of enzymes involved in signal integration which are expressed as a number of different types and splice variants yield another dimension that determines signal integration properties Biosensor imaging provides direct temporal and spatial measurement of intracellular signals This novel approach together with more conventional methods such as biochemistry electrophysiology and modeling now provide a better understanding of the spatial and temporal features of cyclic nucleotide signal integration in living neurons This topic aims at providing a better understanding of how neurons are making sense of cyclic nucleotide signaling in living neurons

associate stimuli with their consequences Following memory acquisition and consolidation circumstances may arise that necessitate that initially learned behaviour is no longer relevant The ensuing process is called extinction learning and involves a novel and complex learning procedure that involves a large number of neural entities While the neural fundamentals of the initial acquisition are well studied our understanding of the behavioural and neural basis of extinction is still limited and derives mostly from rodent data acquired through fear conditioning paradigms Fear conditioning and extinction in rodents is a spectacularly successful paradigm within behavioral neuroscience However in recent years new approaches have been emerging that examine the mechanisms of extinction learning in different setting that also involve appetitive models a broader comparative perspective a focus on other brain systems an examination of hormonal factors and conditioning of immune responses Only a broader analysis of the neural fundamentals of extinction learning will finally uncover shared and distinct mechanisms that underlie extinction learning in different functional systems The papers compiled in this Research Topic offer new and valuable insights into the mechanisms and functional implementation of extinction learning at its different levels of complexity and form the basis for new concepts and research ideas in this field **Pathophysiology -**
