

Oxidation and Reduction

What happens when electrons are transferred in a chemical reaction?

Why?

Silver tarnishes when it comes in contact with sulfur compounds in the air. Copper gets coated in beautiful green patina as it ages. Metals rust or corrode in the presence of air and water. Minerals (ionic compounds) found in ore can be decomposed with the use of electricity to produce pure metals and nonmetals. All of these reactions are examples of oxidation and reduction, otherwise known as **redox** reactions. In this activity you will explore what is happening at the atomic level in redox reactions.

Model 1 – Redox Reactions

Redox Reactions

1. What two types of reactions are shown in Model 1?

Redox & Nonredox

2. Examine the redox and nonredox reactions in Model 1. Is/are there any feature(s) in the redox reactions that would allow you to identify them as redox reactions? If yes, use specific examples from Model 1 to support your answer.

Redox Models in Chemistry Lise-Lotte Österlund, Margareta Ekborg, Anders Berg, 2010 *Investigation Into the Role of Redox Reactions in Maillard Model Systems* Luke John William Haffenden, 2007 The role of redox reactions in the formation of aroma volatiles colour and other non volatiles in the Maillard Reaction was investigated The electrochemical properties of individual reactants and Maillard model mixtures were monitored via ORP oxidation reduction potential and oxygen electrodes All models exhibited unique electrochemical activities represented by their corresponding ORP profiles Investigation into the redox potentials of several model systems demonstrated that the increased negative value of a redox potential is not necessarily correlated with its browning potential An optimal redox potential range where browning is favoured was found to represent a balance between carbonyl and hydroxyl moieties in the structure Adjustment of this redox potential by introducing reducing or oxidizing species can shift this balance resulting in modifications in browning capacities However it

was concluded that there is a clear relationship between browning ability and reducing capacity of the model systems Furthermore a novel oxidative pyrolysis technique was developed to study the role of oxidative environment on the product distribution during pyrolysis and to investigate the mechanism of formation of non volatiles through ^{13}C and ^{15}N label incorporation Application of this technique to glucoselycine model system have indicated that most non volatile Maillard reaction products can arise from glucose oxidation intermediates such as glucosone gluconic acid and deoxyglucosones To study the specific role of redox reactions in the formation of non volatiles a post pyrolytic derivatization technique was developed and optimized Several non volatile end products were identified and mechanistically confirmed to involve oxidation and reduction reactions for their formation such as lactones hydroxylated benzenes and hydroxylated pyrazine The latter was identified and confirmed to be generated via the dimerization of glycine and subsequent oxidation In addition the formation of different volatiles such as pyrazole imidazole and oxazole was mechanistically confirmed to depend on redox reactions

Sustainable and Functional Redox Chemistry Shinsuke Inagi, 2022-04-29 Mimicking nature's efficiency and sustainability in organic chemistry is a major goal for future chemists redox reactions are a key element in a variety of fields ranging from synthesis and catalysis to materials chemistry and analytical applications Sustainability is increasingly becoming a consideration in synthesis and functional chemistry and an essential element for the next generation of chemistry in academia and industry This book represents a compilation of the latest advancements in functional redox chemistry and demonstrates its importance in achieving a more sustainable future This book is an ideal companion for any postgraduate students or researchers interested in sustainability in academia and industry

Redox J. Schüring, H.D. Schulz, W.R. Fischer, Jürgen Böttcher, W.H.M. Duijnisveld, 2000-01-24 Few processes are as important for environmental geochemistry as the interplay between the oxidation and reduction of dissolved and solid species The knowledge of the redox conditions is most important to predict the geochemical behaviour of a great number of components the mobilities of which are directly or indirectly controlled by redox processes The understanding of the chemical mechanisms responsible for the establishment of measurable potentials is the major key for the evaluation and sensitive interpretation of data This book is suitable for advanced undergraduates as well as for all scientists dealing with the measurement and interpretation of redox conditions in the natural environment

Principles of Redox Reactions Malika Ammam, 2018-03-05 As a teacher of physical chemistry I noticed that students even in advanced classes have difficulties in understanding the basics of redox chemistry In this Section 3 I attempted to discuss some fundamental principles related to redox processes by focusing on the species that might lose or gain electrons determination of the oxidation numbers or states

of atoms in compounds and ways of balancing redox reactions To further clarify the discussed concepts numerous questions and problems with detailed answers are provided Most of these questions are formulated by students like you I believe that this Section 3 would greatly help students with levels varying from high school to advanced university classes
