**Scenarios: Models, Transformations and Tools** Stefan Leue, Tarja J. Systä, 2005-08-25 Visual notations and languages continue to play a pivotal role in the design of complex software systems In many cases visual notations are used to scribe usage or interaction scenarios of software systems or their components While representing scenarios using a

visual notation is not the only possibility a vast majority of scenario description languages is visual Scenarios are used in telecommunications as Message Sequence Charts in object oriented system design as Sequence Diagrams in reverse engineering as execution traces and in requirements engineering as for example Use Case Maps or Life Sequence Charts These techniques are used to capture requirements to capture use cases in system documentation to specify test cases or to visualize runs of existing systems They are often employed to represent concurrent systems that interact via message passing or method invocation In telecommunications for more than 15 years the International Telecommunication Union has standardized the Message Sequence Charts MSCs notation in its recommendation Z 120 More recently with the emergence of UML as a predominant software design methodology there has been special interest in the development of the sequence diagram notation As a result the most recent version 2.0 of UML encompasses the Message Sequence Chart notation including its hierarchical modeling features Other scenario oriented diagrams in UML 2.0 include activity diagrams and timing diagrams

**Theory and Practice of Model Transformations** Laurence Tratt, Martin Gogolla, 2010-06-17 Model transformations are the glue that tie modelling activities together If you've used modelling in anger then whether you know it or not you've used model transformations They come in all shapes and sizes from moving models between different tools to generating implementations Model transformations have humble beginnings at one point not long ago it was said by many in the know that the way forward in model transformations was to use XSLT That this idea now raises a wry smile shows how far the model transformation community has come in a short time Where once model transformations were hacked together in a variety of unsuitable languages we now have a number of powerful dedicated languages and theories at our disposal Since 2008 the ICMT conference series has played a huge part in advancing the subject and this third edition was no different The theories and languages presented at ICMT have allowed principled model transformations to play an ever greater part in real systems Of course there is still much more to do we need our model transformations languages and theories to scale further allow greater expressivity be more extensible and aid reusability and we lack empirically backed studies of model transformations in use Doubtless you can think of other gaps Yet though some real world challenges lie just beyond our reach each year sees once daunting problems conquered Much of that progress is now driven by ICMT and this year's edition showed how model transformations are increasingly being used in previously unfamiliar areas

**The Geology of Stratigraphic Sequences** Andrew D. Miall, 2013-06-29 Sequence stratigraphy represents a new paradigm in geology The principal hypothesis is that stratigraphic successions may be subdivided into discrete sequences bounded by widespread unconformities There are two parts to this hypothesis First it suggests that the driving forces which generate sequences and their bounding unconformities also generate predictable three dimensional stratigraphies In recent years stratigraphic research guided by sequence models has brought about fundamental improvements in our understanding of stratigraphic processes and the controls of basin architecture Sequence models have provided a powerful framework for mapping and

numerical modeling enabling the science of stratigraphy to advance with rapid strides This research has demonstrated the importance of a wide range of processes for the generation of cyclic sequences including eustasy tectonics and orbital forcing of climate change The main objective of this book is to document the sequence record and to discuss our current state of knowledge about sequence generating processes

**Modeling Practice and Mechanism Design of Green Energy Systems towards Sustainable Development** Jianli Zhou, Lirong Liu, Meiheriayi Mutailipu, Shuai Geng, Shenbo Yang, Ting Zhang, 2025-03-12 The sustainable development of energy has become a global concern The energy system as an extremely important module for production conversion transmission and supply in the energy industry is facing pressure from deep decarbonization and green transformation The application of wind power photovoltaic hydrogen energy power to gas P2G technology carbon capture utilization and storage CCUS technology will help the energy system achieve the Sustainable Development Goals Hydrogen energy will become a bridge for various energy conversion promoting the high speed flow of green energy Therefore modeling practice and mechanism design for green energy systems will become a key area of academic research The full utilization and consumption of renewable energy generation e g wind and photovoltaic still face difficulties and challenges especially the problem of full consumption The development and layout of multi energy complementarity coupling and interaction and collaborative integrated energy systems can effectively solve the above problems Therefore there is an urgent need to study the mechanism planning and design optimized operation development mode carbon emission reduction energy policies and trading mechanisms of integrated energy systems coupled with renewable energy generation and hydrogen energy to promote its further development and help achieve a clean and sustainable future This field will integrate the knowledge and methodology from energy science power electronics management science and economics

#### **Undergraduate Mathematics for the Life Sciences** Glenn Ledder, Jenna P.

Carpenter, Timothy D. Comar, 2013 There is a gap between the extensive mathematics background that is beneficial to biologists and the minimal mathematics background biology students acquire in their courses The result is an undergraduate education in biology with very little quantitative content New mathematics courses must be devised with the needs of biology students in mind In this volume authors from a variety of institutions address some of the problems involved in reforming mathematics curricula for biology students The problems are sorted into three themes Models Processes and Directions It is difficult for mathematicians to generate curriculum ideas for the training of biologists so a number of the curriculum models that have been introduced at various institutions comprise the Models section Processes deals with taking that great course and making sure it is institutionalized in both the biology department as a requirement and in the mathematics department as a course that will live on even if the creator of the course is no longer on the faculty Directions looks to the future with each paper laying out a case for pedagogical developments that the authors would like to see
