

## Free Particle (Block) Worksheet 2: In 1 dimension

1. Explain what is meant by free and give an example.

A free particle is a particle which has no forces acting on it. This means that the particle is not subject to any external forces. It is free to move in any direction and with any speed. The only force acting on it is the force of gravity, which is assumed to be negligible. This means that the particle is free to move in any direction and with any speed.

2. Give an example of a free particle (must be realistic, realistic example). Give the properties of the free particle (e.g. mass, energy, momentum, charge, spin, etc.).

One example of a free particle is a photon. A photon is a particle of light, and it has no mass. It is free to move in any direction and with any speed. The only force acting on it is the force of gravity, which is assumed to be negligible. This means that the photon is free to move in any direction and with any speed. Another example of a free particle is an electron. An electron is a particle of matter, and it has a small mass. It is free to move in any direction and with any speed. The only force acting on it is the force of gravity, which is assumed to be negligible. This means that the electron is free to move in any direction and with any speed.

3. Is the free particle still free if it is subject to a constant force? Explain.

No, it is not. A free particle is one that is not subject to any forces. If a particle is subject to a constant force, it is not free. For example, a particle subject to a constant force will accelerate, and its speed will increase. This means that the particle is not free to move in any direction and with any speed.

4. Describe the free particle in quantum mechanics. Give the wave function and the probability density.

In quantum mechanics, a free particle is described by a wave function. The wave function is a function of position and time. The probability density is the square of the absolute value of the wave function. This means that the probability density is a function of position and time.

The wave function is a function of position and time. It is a complex-valued function. The probability density is the square of the absolute value of the wave function. This means that the probability density is a function of position and time.
