

As you read through this section of your textbook, answer the following questions.

| Main Ideas | Vocabulary |
|--|--|
| <ul style="list-style-type: none"> ➤ Humans share a common ancestor with other primates. ➤ There are many fossils of extinct hominins. ➤ All extant humans arose roughly 200,000 years ago. | <ul style="list-style-type: none"> Primate Prosimian Anthropoid |

2. Humans share a common ancestor with other primates.
1. What is a primate? Explain how humans fit this definition.

Primate Evolution

Compare to other group-defining programs, the relationship among the primate groups forms a many-branched tree. At the tree's base is the common ancestor of all primates. Just above this base, the tree splits into two main subgroups: the prosimians and the anthropoids.

1. What are the differences between prosimians and anthropoids?
2. How are hominids different from other anthropoids?

Walking upright

Animals that can walk on two legs are called bipedal. This trait has important adaptive advantages. It allows higher reach into tree branches while foraging, and perhaps most important, it frees the hands for foraging, carrying infants and food, and using tools.

4. Compared to larger brains and tool use, when did being bipedal occur in hominids? What evidence is there for this?
