Introduction

In England in the early 1800s, right when natural selection was being proposed, people began to notice that some of the pigeons in their cities were different from the ones that were in the countryside. Some of the pigeons in the cities were different from the ones in the countryside in the way they looked, the way they behaved, and the way they lived. Some of the pigeons in the cities were different from the ones in the countryside in the way they looked, the way they behaved, and the way they lived. Some of the pigeons in the cities were different from the ones in the countryside in the way they looked, the way they behaved, and the way they lived.

Charles Darwin is famous for his theory of evolution. He proposed that the natural world changes over time. He proposed that the natural world changes over time. He proposed that the natural world changes over time. He proposed that the natural world changes over time. He proposed that the natural world changes over time.

The **peppered moth** (shown below) is an example of a species that has changed over time. In the 1800s, most peppered moths were light-colored. But by the 1900s, many peppered moths were dark-colored. This change was caused by natural selection.

Intrinsically Motivated Learning in Natural and Artificial Systems Gianluca Baldassarre, Marco Mirolli, 2013-03-29 It has become clear to researchers in robotics and adaptive behaviour that current approaches are yielding systems with limited autonomy and capacity for self improvement To learn autonomously and in a cumulative fashion is one of the hallmarks of intelligence and we know that higher mammals engage in exploratory activities that are not directed to pursue goals of immediate relevance for survival and reproduction but are instead driven by intrinsic motivations such as curiosity interest in novel stimuli or surprising events and interest in learning new behaviours The adaptive value of such intrinsically motivated activities lies in the fact that they allow the cumulative acquisition of knowledge and skills that can be used later to accomplish fitness enhancing goals Intrinsic motivations continue during adulthood and in humans they underlie lifelong learning artistic creativity and scientific discovery while they are also the basis for processes that strongly affect human well being such as the sense of competence self determination and self esteem This book has two aims to present the state of the art in research on intrinsically motivated learning and to identify the related scientific and technological open challenges and most promising research directions The book introduces the concept of intrinsic motivation in artificial systems reviews the relevant literature offers insights from the neural and behavioural sciences and presents novel tools for research The book is organized into six parts the chapters in Part I give general overviews on the concept of intrinsic motivations their function and possible mechanisms for implementing them Parts II III and IV focus on three classes of intrinsic motivation mechanisms those based on predictors on novelty and on competence Part V discusses mechanisms that are complementary to intrinsic motivations and Part VI introduces tools and experimental frameworks for investigating intrinsic motivations The contributing authors are among the pioneers carrying out fundamental work on this topic drawn from related disciplines such as artificial intelligence robotics artificial life evolution machine learning developmental psychology cognitive science and neuroscience The book will be of value to graduate students and academic researchers in these domains and to engineers engaged with the design of autonomous adaptive robots The contributing authors are among the pioneers carrying out fundamental work on this topic drawn from related disciplines such as artificial intelligence robotics artificial life evolution machine learning developmental psychology cognitive science and neuroscience The book will be of value to graduate students and academic researchers in these domains and to engineers engaged with the design of autonomous adaptive robots

The fourth industrial revolution according to the World Economic Forum is about to begin This will blend the physical and digital worlds in ways we couldn t imagine a few years ago Advances in machine learning and AI will help usher in these existing changes Machine learning is transformative which opens up new scenarios that were simply impossible a few years ago Profound gaining addresses a significant change in perspective from customary programming improvement models Instead of having to write explicit top down instructions for how software should behave deep learning allows your software to generalize rules of operations Deep learning models empower the engineers to configure characterized by the information without the guidelines to compose Deep learning models are conveyed at scale and creation applications for example car gaming medical services and independent vehicles Deep learning models employ artificial neural networks which are computer architectures comprising multiple layers of interconnected components By avoiding data transmission through these connected units a neural network can learn how to approximate the computations required to transform inputs to outputs Deep learning models require top notch information to prepare a brain organization to carry out a particular errand Contingent upon your expected applications you might have to get thousands to millions of tests This chapter takes you on a journey of AI from where it got originated It does not just involve the evolution of computer science but it involves several fields say biology statistics and probability Let us start its span from biological neurons way back in 1871 Joseph von Gerlach proposed the reticulum theory which asserted that the nervous system is a single continuous network rather than a network of numerous separate cells According to him our human nervous system is a single system and not a network of discrete cells Camillo Golgi was able to examine neural tissues in greater detail than ever before thanks to a chemical reaction he

discovered He concluded that the human nervous system was composed of a single cell and reaffirmed his support for the reticular theory In 1888 Santiago Ramon y Cajal used Golgi s method to examine the nervous system and concluded that it is a collection of distinct cells rather than a single cell
