The Oxford Handbook of Cognitive Science Susan E. F. Chipman, 2016-11-10 Cognitive Science is an avowedly multidisciplinary field drawing upon many traditional disciplines or research areas including Linguistics, Neuroscience, Philosophy, Psychology, Anthropology, Artificial Intelligence, and Education that contribute to our understanding of cognition. Just as learning and memory cannot truly prove effective as disconnected studies, practical applications of cognitive research such as the improvement of education and human-computer interaction require dealing with more complex cognitive phenomena by integrating the methods and insights from multiple traditional disciplines. The societal need for such applications has played an important role in the development of cognitive science. The Oxford Handbook of Cognitive Science emphasizes the research and theory that is most central to modern cognitive science. Sections of the volume address computational theories of human cognitive architecture, cognitive functioning such as problem solving and decision making as they have been studied with both experimental methods and formal modeling approaches, and cognitive linguistics and the advent of big data. Chapters provide concise introductions to the present achievements of cognitive science, supplemented by references to suggested reading, and additional facets of cognitive science are discussed in the handbook's introductory chapter, complementing other key publications to access for further study. With contributions from among the best representatives in their fields, this volume will appeal as the critical resource for the students in training who determine the future of cognitive science.

Colorado Online Learning, 2011 **Brain and Mathematical Cognition** Xinlin Zhou, 2024-08-01 This book intends to present a series of insights coming from an in-depth investigation of brain and mathematical cognition in Chinese population. Specifically, the book introduces research on the associations among number sense, visual form perception, and mathematical fluency, symbolic and non-symbolic mental number line, and the role of spatial modeling and logical inference in mathematical problem solving. The book summarizes the author's previous studies on the involvement of semantic network other than visuospatial network in mathematical cognition. The three-component mathematical model that comes out of more than 10 years of research on mathematical cognition is introduced. The book presents the effect of learning experience on arithmetic-related brain system. Chinese abacus that can be used to eradicate developmental dyscalculia in classroom is briefly discussed. Special attention in this book is paid to mathematical anxiety and mathematical learning disorders in Chinese schoolchildren. Finally, gender differences in mathematical cognition are also reviewed.
