

(A) The drilling crew pulls the rope. The drill bit is lifted from the bottom of the hole and the valve closes. The drilling tubes are full of water.

The valve is the key to the whole process. A valve consists of a bottleneck shaft within the drilling tubes. It is equipped with a marble that can move freely within the shaft. As the bit is lifted, the marble falls and closes down the opening. This pushes up the water column and prevents losses. When the bit is allowed to fall, the marble is momentarily lifted. This allows water and sediment in.

(B) The drilling crew lets go of the rope. As the bit hits the bottom of the hole it breaks the rock. The valve is open momentarily due to the inertia of the fall. This allows water and loosened rock to come into the drilling tubes.

(C) The bit is lifted as the crew pulls again. The valve closes, pushing up the water column inside the hollow tubes. Water and sediments are expelled through the mouth, falling into a decanter. Water in the decanter may flow back into the hole, while sediments remain outside.
