## Human reproduction

Human reproduction involves male and female reproductive cells called gametes. The reproductive system includes organs called gonads that produce gametes and hormones; ducts for transport, storage and transportation of gametes; accessory organs and glands for fluid secretion; and internal genitalia. Reproduction is regulated by hormones produced by the gonads, the hypothalamus and the pituitary gland. Fertilisation involves the introduction of sperm into the vagina. The sperm travels through the female reproductive tract until it encounters an ovum, a female sex cell. Fertilisation can then take place.

## Male reproductive system

The adult male reproductive system is a collection of two primary external structures, the testes and the penis. The testes are divided into thousands of tiny compartments or tubules containing seminiferous tubules, tightly coiled structures where sperm formation takes place.

The testes are situated in a sac called the scrotum, which provides support and regulates the position of the testes relative to the body. The scrotum is located below the testes, near the perineum, to maintain the testes at a temperature slightly below body temperature for sperm formation.

Seminiferous tubules produce sperm cells, which are transported to the epididymis, a structure located on top of the testes. The epididymis is responsible for maturing the sperm and for moving them into the vas deferens, a tube that carries sperm from the testes to the urethra and out of the body during ejaculation.

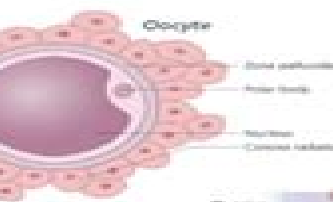

## Fertilization

The upper portion of the vagina leads to the vaginal canal for fertilisation. Millions of sperm travel through the female reproductive tract, ultimately reaching the egg. Within a sperm, the nucleus contains the genetic material. The sperm travels through a path made by the digestive cells of the vagina. When the cell membrane of the egg and sperm come in contact, the membranes fuse, and the sperm nucleus and associated material enter the egg. Other sperm are prevented from entering by a chemical change in the zona pellucida. The egg nucleus membrane dissolves the chromosomes of the egg and sperm combine, and a fertilised egg, or zygote, is formed. The change process starts with a nuclear division, producing 2 identical cells called blastomeres.

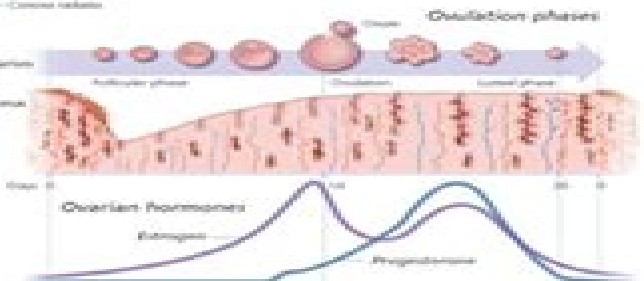

## Female reproductive system

The internal structures of the adult female reproductive system include the vagina, uterus, ovaries and oviducts. These structures form a pathway allowing the release of an egg cell, fertilisation, its growth and delivery of a developed fetus. The vagina is a muscular canal that receives the penis during intercourse and serves as the birth canal. It is a tube that carries sperm from the uterus to the vagina. The uterus is a hollow, pear-shaped organ with muscular walls that contract during childbirth. The lower part of the uterus is the cervix, which opens into the vagina. The ovaries are located on each side of the uterus and are responsible for producing eggs as well as the female sex hormones estrogen and progesterone. The ovaries are responsible for the development of the female reproductive system, including the uterus, vagina and cervix. The ovaries are responsible for the production of eggs and for the release of eggs during ovulation. ## Ovulation & the menstrual cycle

The menstrual cycle refers to the sequence of events that occurs in the endometrium, the lining of the uterus. The cycle typically lasts approximately 28 days. The purpose is to prepare the uterus for possible pregnancy. The menstrual cycle is governed by the endocrine system. It involves the release of eggs from the ovaries and the shedding of the uterine lining. The menstrual cycle is governed by the endocrine system. **HUMAN ANATOMY AND PHYSIOLOGY-II** Mrs. Sakshi Sharma, Mrs.

Shweta Sandeep Satkar, Ms. Priyanka D. Yadav, Dr. Ayushi Purohit, Dr. Sourabh Sharma, 2025-05-02 Textbook of Human Anatomy and Physiology II is a comprehensive guide designed to deepen understanding of human body systems. It begins with an in-depth look at the nervous system, exploring neurons, synapses, and neurotransmitters. The central nervous system section delves into brain structure, spinal cord functions, and reflex activity. In the digestive system, it details the anatomy and roles of major organs like the stomach, intestines, liver, and pancreas. Processes like digestion, absorption, and related gastrointestinal disorders are clearly explained. The energetics chapter introduces ATP production and basal metabolic rate, emphasizing cellular energy dynamics. The respiratory system is presented with focus on lung anatomy, gas transport, and artificial respiration techniques. Anatomy and physiology of the urinary system, including nephrons and kidney functions, are thoroughly discussed. It also explains the micturition reflex and kidney roles in pH regulation and the renin-angiotensin system. The endocrine system section offers detailed insights into hormone mechanisms and glandular disorders. Structures and functions of glands like the pituitary, thyroid, adrenal, and pancreas are carefully outlined. The roles of lesser-known glands like the pineal and thymus are also explored in depth. The reproductive system chapter covers both male and female anatomy, physiology, and reproductive cycles. It explains complex processes like menstruation, fertilization, pregnancy, and parturition. Key reproductive events like spermatogenesis and oogenesis are clearly illustrated. The book ends with a foundational introduction to genetics, touching on chromosomes and DNA. Concepts like protein synthesis and patterns of inheritance help bridge physiology with molecular biology. The language is student-friendly, supported with diagrams and clinical correlations. Each system is explained functionally and structurally, reinforcing learning through physiological context. Ideal for students in health and life sciences, this book builds a strong base in human anatomy and physiology.
