

HEATING METAL CARBONATES

Decomposition is the breakdown of a compound into simpler substances. Some compounds can be broken down using heat – this is **thermal decomposition**. Some compounds can be broken down using electricity – this is **electrical decomposition** (also called **electrolysis**).

Many metal carbonates break down when heated as shown: metal carbonate → metal oxide + carbon dioxide

AIM

- 1) To find out which metal carbonates decompose on heating in a Bunsen flame.
- 2) To link the ease with which a metal carbonate decomposes to the reactivity of the metal in the compound.

Reactivity series of metals	Most reactive metal	↑	potassium magnesium zinc copper
	Least reactive metal		

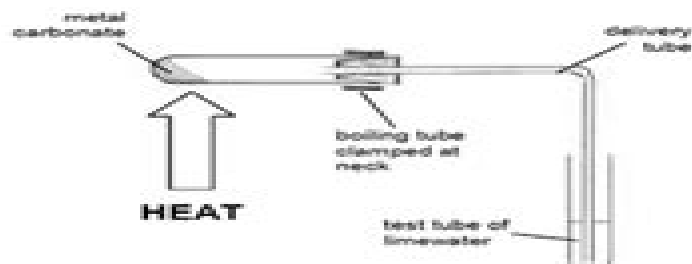

VARIABLES

Independent variable	Dependent variable	Control variables
☐ categoric ☐ continuous	☐ categoric ☐ continuous	

METHOD

 Wear eye protection	 Be careful of hot apparatus. Remove the delivery tube out of the limewater before you stop heating.	 copper carbonate	 potassium carbonate limewater
---	--	--	--

- 1) Place two spatula loads of one of the metal carbonates in a dry test tube clamped horizontally as shown in the diagram.
- 2) Heat the tube with a hot Bunsen flame.
- 3) Time how long it takes for the limewater to turn cloudy.
- 4) Remove the tube with the limewater before you stop heating.
- 5) Do not heat for more than 4 minutes even if it does not turn cloudy.
- 6) Repeat for each metal carbonate. Each time use a clean test tube for the metal carbonate and fresh limewater.

Biogeochemical Cycling and Depositional Processes of Critical Metals in the Deep Sea and Their Constraints on Global Changes Jiangbo Ren, Yanhui Dong, Xiaodong Jiang, Francisco Javier González, 2025-10-28

Critical metals such as cobalt Co nickel Ni and rare earth elements REEs are highly concentrated in deep sea sediments particularly in ferromanganese deposits mainly due to low sedimentation rate and low detrital input The deep sea water sediment interface constitutes a pivotal area for the biogeochemical cycling and depositional processes of critical metal elements However the behavior of critical metals at the deep seawater sediment interface is complicated by global or regional environmental factors such as encompassing changes in productivity redox alterations ocean current dynamics volcanism hydrothermalism tectonic activity A comprehensive understanding of the migration of critical metals between seawater and pore water their accumulation and occurrence characteristics in solid mineral resources and sediments as well as their preservation status holds paramount significance in systematically elucidating the formation mechanism of solid minerals and accurately interpreting paleoenvironmental records Exploring the deposition and enrichment of critical metals in the deep sea through the lens of biogeochemical cycles and global change is poised to yield significant scientific insights The focus of this Research Topic is to study critical metals across the marine environment encompassing seawater pore water and deep sea sediments to explore the behavior of the elements in seawater seafloor deposition and enrichment processes and their constraints on global change This Research Topic calls for original and novel papers that explore biogeochemical cycling and depositional processes of critical elements in the deep sea and their constraints on global changes We invite submissions that address but are not limited to the following topics 1 The trace metal distributions in the water column at the seawater sediment interface and within sediments reveal elemental biogeochemical behavior in the ocean 2 Polymetallic ferromanganese depositional profiles record critical metal enrichment processes in a long period changing environment 3 Deep sea sediments and ferromanganese deposits are important elemental and isotopic archives that record important global change events 4 Deep sea sedimentation in response to bottom current including Antarctic Bottom Water 5 Biomineralization processes and seafloor metals deposition

Sediment Hosted Lead-Zinc Sulphide Deposits M. Deb, Wayne David Goodfellow, 2004 The Deposit Modeling Program was founded by UNESCO IUGS with the major aim to disseminate knowledge from scientists in more developed countries to their counterparts from less developed ones A fringe benefit of this effort was the compilation of information on existing models and promotion of topical workshops in developing countries This book is the result of one such workshop that took place in Delhi and Udaipur India in December 2001 Sediment hosted Lead Zinc Sulphide Deposits compiles the work of renowned economic geologists from three continents The authors highlight the recent advances in the understanding of the temporal and tectono stratigraphic distribution of sediment hosted Pb Zn sulphide ores and processes

governing their genesis The first section comprises five chapters covering some of the most important deposits of this class in Australia and Canada in detail emphasizing their genetic models It also includes a paper on the geoenvironmental model which concerns behavior before mining and resulting from mining processing and smelting The second section discusses the mineralized terranes in the state of Rajasthan northwest India which host three major sulphide deposits This reference is packed with color and black and white photographs illustrations charts and graphs making it a valuable up to date resource for any geologist or geotechnical scientist studying major mineral deposits
