ignition system. The switch is actuated by vacuum from the cylinder. When a high vacuum pull is exerted against the switch, during engine operation in gear without the lower unit in the water, the switch is closed and the engine is shut down. This feature is a safeguard against the engine "running away" while operating with a no-load condition on the propeller. A two-cycle engine will continue to increase rpm under a no-load condition and attempts to shut it down will fail, resulting in serious damage or destruction of the unit.

The vacuum switch also serves as a safety feature when the boat is operating in the water. If the propeller is released from the

shaft, because of an accident, striking an underwater object, whatever, the engine would then be operating under a no-load condition. The vacuum switch will shut down the engine and prevent extensive damage, resulting from a "run-a-way" condition.

This cutoff switch arrangement was installed on all 28, 33, and 35 hp engines, 1958-59, and all 40 hp engines covered in this manual.

Therefore, if spark is not present at the spark plug, disconnect the wires from the vacuum switch and again test for spark at the spark plug. If spark is present with the vacuum switch disconnected, the switch is defective and must be replaced.
