outside of information system facility and can be intentional or unintentional The precise calculation of losses caused by such incidents is often not possible because a number of small scale ISS incidents are never detected or detected with a significant time delay a part of incidents are interpreted as an accidental mistakes and all that results with an underestimation of ISS risks This paper addresses the different types and criteria of information system security risks threats classification and gives an overview of most common classifications used in literature and in practice We define a common set of criteria that can be used for information system security threats classification which will enable the comparison and evaluation of different security threats from different security threats classifications
