Havin,N.K. Nikol'skij,2012-12-06 The theory of generalized functions is a general method that makes it possible to consider and compute divergent integrals sum divergent series differentiate discontinuous functions perform the operation of integration to any complex power and carry out other such operations that are impossible in classical analysis Such operations are widely used in mathematical physics and the theory of differential equations where the ideas of generalized functions first arose in other areas of analysis and beyond The point of departure for this theory is to regard a function not as a mapping of point sets but as a linear functional defined on smooth densities This route leads to the loss of the concept of the value of function at a point and also the possibility of multiplying functions but it makes it possible to perform differentiation an unlimited number of times The space of generalized functions of finite order is the minimal extension of the space of continuous functions in which coordinate differentiations are defined everywhere In this sense the theory of generalized functions is a development of all of classical

analysis in particular harmonic analysis and is to some extent the perfection of it The more general theories of ultradistributions or generalized functions of infinite order make it possible to consider infinite series of generalized derivatives of continuous functions
