

MEMORANDUM FOOD TESTING

The nutrients in the food you eat supply your body with energy for growth and repair. These nutrients include carbohydrates, proteins, fats, minerals and vitamins. The presence of these nutrients in food can be tested by using **chemical indicators /reagents** that react in predictable ways. A **colour change** of an indicator is usually a **positive test** for the presence of a certain nutrient. In this practical, you will use several indicators to test for the presence of nutrients in solutions.

INSTRUCTIONS:

- You will perform **FOUR different tests** on **TWO experimental samples**.
- Each test will use a different **indicator reagent** that will change colour in the presence of the particular organic compound that is being tested for.
- As part of the experimental method, you must include **control samples** to insure the validity of your results.

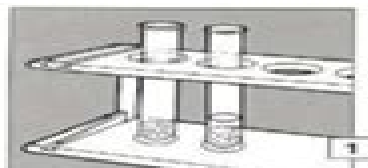

A **negative control** will result in no change in colour. It will either contain no sample at all or it will contain a nonreactive sample like water.

A **positive control** will result in a colour change indicating the presence of the compound you are testing for.

- **Answer the questions** each time the food test has been completed in the appropriate spaces

The Wiley Handbook of Contextual Behavioral Science Robert D. Zettle,Steven C. Hayes,Dermot Barnes-Holmes,Anthony Biglan,2016-01-19 The Wiley Handbook of Contextual Behavioral Science describes the philosophical and empirical foundation of the contextual behavioral science movement it explores the history and goals of CBS explains its core analytic assumptions and describes Relational Frame Theory as a research and practice program This is the first thorough examination of the philosophy basic science applied science and applications of Contextual Behavioral Science Brings together the philosophical and empirical contributions that CBS is making to practical efforts to improve human wellbeing Organized and written in such a way that it can be read in its entirety or on a section by section basis allowing readers to

choose how deeply they delve into CBS Extensive coverage of this wide ranging and complex area that encompasses both a rich basic experimental tradition and in depth clinical application of that experimental knowledge Looks at the development of RFT and its implications for alleviating human suffering Quantum Structures in Cognitive and Social Science Diederik Aerts, Jan Broekaert, Liane Gabora, Sandro Sozzo, 2016-06-26 Traditional approaches to cognitive psychology correspond with a classical view of logic and probability theory More specifically one typically assumes that cognitive processes of human thought are founded on the Boolean structures of classical logic while the probabilistic aspects of these processes are based on the Kolmogorovian structures of classical probability theory However growing experimental evidence indicates that the models founded on classical structures systematically fail when human decisions are at stake These experimental deviations from classical behavior have been called paradoxes fallacies effects or contradictions depending on the specific situation where they appear But they involve a broad spectrum of cognitive and social science domains ranging from conceptual combination to decision making under uncertainty behavioral economics and linguistics This situation has constituted a serious drawback to the development of various disciplines like cognitive science linguistics artificial intelligence economic modeling and behavioral finance A different approach to cognitive psychology initiated two decades ago has meanwhile matured into a new domain of research called quantum cognition Its main feature is the use of the mathematical formalism of quantum theory as modeling tool for these cognitive situations where traditional classically based approaches fail Quantum cognition has recently attracted the interest of important journals and editing houses academic and funding institutions popular science and media Specifically within a quantum cognition approach one assumes that human decisions do not necessarily obey the rules of Boolean logic and Kolmogorovian probability and can on the contrary be modeled by the quantum mechanical formalism Different concrete quantum theoretic models have meanwhile been developed that successfully represent the cognitive situations that are classically problematical by explaining observed deviations from classicality in terms of genuine quantum effects such as contextuality emergence interference superposition entanglement and indistinguishability In addition the validity of these quantum models is convincingly confirmed by new experimental tests We also stress that since the use of a quantum theoretic framework is mainly for modeling purposes the identification of quantum structures in cognitive processes does not presuppose without being incompatible with it the existence of microscopic quantum processes in the human brain In this Research Topic we review the major achievements that have been obtained in quantum cognition by providing an accurate picture of the state of the art of this emerging discipline Our overview does not pretend to be either complete or exhaustive But we aim to introduce psychologists and social scientists to this challenging new research area encouraging them at the same time to consider its promising results It is our opinion that if continuous progress in this domain can be realized quantum cognition can constitute an important breakthrough in cognitive psychology and potentially open the way towards a new scientific paradigm in social science **Olympiad**
