*** Rear ride height, axle load and LR tilt

* Softening/Softening RR spring affects entry/exit by changing the dynamic cross weight of the car. Too big of an adjustment to the RR spring can have an opposite affect, especially on a slick track

A good starting point for the RR spring rate on a tacky track is 200lbs + 200lbs

** Adjusting just one side of the J-Bar can sometimes cause opposite the desired result. This can be due to the J-Bar Rule. More J-Bar Rule can cause the car to rotate more on throttle, Less rule can have less rotation

† Axle load will usually affect the entire corner

important things to consider:

Remember there are two types of "Loose" and "Tight"

Types of Loose:

1. A car can be loose because the rear tires don't have enough grip

This can cause the rear end to slide around

2. A car can also be loose because the RR has too much grip

This can make the car over rotate because the RR is slowing the car around

Types of Tight:

1. A car can be tight because the front tires don't have enough grip

This can cause the front end to cross gear up the track

2. A car can be tight because the LF has too much grip

This can cause the car to under rotate because the LF has too much grip

Drop Chart:

20-100 is a good starting point for your Drop Chart

Increasing Drop can increase your fuel and wear. Sometimes but decrease dynamic load on Rear wheels

Increasing Drop can increase dynamic cross weight L/R side

Decreasing Drop can increase dynamic load on both the LF and RR wheels
