**Process and Operation Planning** G. Halevi, 2013-04-17 Process planning determines how a product is to be manufactured and is therefore a key element in the manufacturing process It plays a major part in determining the cost of components and affects all factory activities company competitiveness production planning production efficiency and product quality It is a crucial link between design and manufacturing In spite of the importance of process planning in the manufacturing cycle there is no formal methodology which can be used or can help to train personnel for this job Process planning activities are predominantly labor intensive depending on the experience and the skill and intuition of the planner and therefore often precludes a thorough analysis and optimization of the process plan which nearly always results in higher than necessary production costs delays errors and non standardization of processes Process planning is regarded as an art and not a science Research in the field of process planning has indicated that all experts have their own expertise and one expert's experience might be different from that of another It is rare therefore for two planners to produce the same process Each process will produce the part as specified although different processes will result in different processing times and costs The question is who is an expert By definition an expert is one having or manifesting the knowledge skill and experience needed for success in a particular field or endeavor or one who has acquired special skill in or knowledge and mastery of something

**All-Embracing Manufacturing** Gideon Halevi, 2012-03-22 All embracing manufacturing is a system that aims to dissolve the complexity of the manufacturing process and restore the inherent simplicity It claims that production is very simple and flexible by nature However the complexity is a result of the production system approach which makes it rigid and therefore complex All embracing manufacturing introduces flexibility to production planning it eliminates constraints bottlenecks and disruptions automatically while it restores the simplicity No decision is made ahead of time but only at the time of execution It introduces technology as dominant part of manufacturing It is a computer oriented system that imitates human behavior i.e. practically as any of us behave in daily personal life

manufacturing process leading to increased efficiency Actually the Matrix Manufacturing Method is far more than a mere promise it s already become standard and successful practice at many companies Details of the Matrix Manufacturing Method now make their first ever appearance in Restructuring the Manufacturing Process Applying the Matrix Method describing this important new philosophy of manufacturing management and practical ways to bring its concepts into reality A pioneer of the Matrix Manufacturing Method Halevi presents comprehensive and convincing details behind its rationale and practice The method s foundation incorporate engineering stages technology during production management stages allowing qualified professionals to make crucial decisions at execution time through the use of accurate and flexible engineering data As the book s case histories demonstrate companies that have taken those measures now benefit from a new degree of freedom in the manufacturing cycle and its myriad advantages Numerous theories may have been proposed to create technology driven manufacturing processes what makes the Matrix Manufacturing Theory most valuable is its improvements of all disciplines aspects and activities related to product production Gain that all inclusive competitive edge with Restructuring the Manufacturing Process Applying the Matrix Method

**Japanization at Work** John Bratton,1994-06-10 Japanese management techniques have attracted considerable interest amongst managers and academics Using case studies in manufacturing this book goes beyond generalization in discussing the impacts of Japanese style management on relations between management and workers John Bratton presents a theoretical framework within which Japanese management can be analysed The author describes the changes often on the words of the people directly involved The book explores the hypothesis that just in time production increases managerial control through the application of new technology and worker generated forms of control

Olling, 1997-10-31 In the latter half of the 20th century forces have conspired to make the human community at last global The easing of tensions between major nations the expansion of trade to worldwide markets widespread travel and cultural exchange pervasive high speed communications and automation the explosion of knowledge the streamlining of business and the adoption of flexible methods have changed the face of manufacturing itself and of research and education in manufacturing The acceptance of the continuous improvement process as a means for organizations to respond quickly and effectively to swings in the global market has led to the demand for individuals educated in a broad range of cultural organizational and technical fields and capable of absorbing and adapting required knowledge and training throughout their careers No longer will manufacturing research and education focus on an industrial sector or follow a national trend but rather will aim at enabling international teams of companies to cooperate in rapidly designing prototyping and manufacturing products The successful enterprise of the 21st century will be characterized by an organizational structure that efficiently responds to customer demands and changing global circumstances a corporate culture that empowers employees at all levels and encourages constant communication among related groups and a technological infrastructure that fully supports process improvement and integration In changing itself to keep abreast of the broader transformation in manufacturing the enterprise must look first at its organization and culture and thereafter at supporting technologies      Industrial Management- Control and Profit Gideon Halevi, 2014-05-21 This volume presents controlling tools for management in order to be in a position to communicate with control engineers concerning technological decisions The main objective of manufacturing management is to make profit However in traditional manufacturing systems none of the separate stages in the process support this objective Management is not expert in any of these stages and therefore is dependent on specific experts at each stage and must follow their decisions Each stage has its own first priority which is not profit and cost This means that management does not have real control over these functional stages nor over the process as a whole This book presents controlling tools for management in order to allow them to communicate better with the experts of the particular manufacturing stages to reach better results and higher profits It is shown that most enterprises can improve their efficiency rate by between 25 and 60% by using the tools developed here      *Scalable Enterprise Systems* Vittal Prabhu, Soundar Kumara, Manjunath Kamath, 2012-12-06 The National Science Foundation NSF is the leading sponsor of basic academic research in engineering and its influence far exceeds its budget We think NSF is at its best when it uses that influence to focus interest within the researcher community on critical

new challenges and technologies NSF's Scalable Enterprise Systems (SES) initiative for which we were responsible in our successive terms in the division of Design, Manufacture and Industrial Innovation (DMII) was just such a venture. A collaborative effort spanning NSF's engineering and computer science directorates, SES sought to concentrate the energies of the academic engineering research community on developing a science base for designing, planning and controlling the extended spatially and managerially distributed enterprises that have become the norm in the manufacture, distribution and sale of the products of U.S. industry. The associated issues addressed included everything from management, supply chains to product design, across teams of collaborating companies to e-marketing and make-to-order manufacturing to the information technology challenges of devising interoperable planning and control tools that can scale with exploding enterprise size and scope. A total of 27 teams with nearly 100 investigators were selected from the 89 submitted proposals in the Phase I exploratory part of the effort (see the list below). Seven of these were awarded larger multi-year grants to continue their research in Phase II. As the contents of this book amply illustrate, these investigations continue to flourish with and without direct NSF support.
