Objectives

1. Understand how stress, friction, and plate interactions determine if Earth's surface features, including or shaping the seas.

2. Understand and explain formation of plate boundaries.

3. How physical and geological models of our world help us to see the origin, how it relates to present, important water and plate tectonics.

Introduction

Plate tectonics is the science of the movement of large pieces of the Earth's crust, known as plates, along plate boundaries. These plates move relative to each other, either towards each other (convergent plate boundaries), away from each other (divergent plate boundaries), or past each other horizontally (transform plate boundaries). This theory was first developed in the late 1940s, and is now one of the most important principles of geology.

The theory of plate tectonics describes how the Earth's crust is divided into tectonic plates that move around. Plates are made of solid rock, and they are rigid. They are also broken into smaller pieces, called tectonic plates. These plates move around the Earth's surface, and they are constantly changing shape. The theory of plate tectonics explains how the Earth's crust is divided into tectonic plates, and how these plates move around the Earth's surface.
