Effects of Global Warming

Read for **comprehension** below.

Scientists are measuring multiple effects of global warming on the earth's climate. These include rising sea levels, increased acidity of our oceans, global temperature rises, shrinking glaciers, and more extreme weather events. Each of these effects has different results for our planet and its inhabitants, including a loss of wildlife habitat and damage due to extreme weather events becoming more common. If you recall the difference between climate and weather, you'll know that an extreme heat wave one summer is not an example of global warming, but a gradual increase in the earth's temperature over the past 150 years is.

According to NASA, 97% of experts in climate science worldwide agree that human activity is not only causing more carbon dioxide and other greenhouse gases to be released into the atmosphere, but at a faster rate than has ever happened on Earth before.

What effects of **Global Warming** have you seen locally?

How will the **faster rates** of greenhouse gas release effect you?
