

A simplified version of a DNA molecule.

Mitosis:

Mitosis is a process of separating a cell into two with identical sets of chromosomes. This occurs during growth, repair, cloning and asexual reproduction.

1. Prophase - the cell duplicates its DNA.
2. Metaphase - the centrioles (duplicated DNA) align themselves along the equator (middle) and send out tubules that connect to the centromere and connect the two strands of chromosomes (condensed DNA).
3. Anaphase - half of the chromosomes are pulled one way and vice versa.
4. Telophase - cell membranes close in and split the cell.

The organisation of cells:

Specialised cells that perform similar functions are grouped together as tissues:

There are many types of tissues:

1. Bones - collection of cells that secrete calcium salts.
2. Muscle - these can be voluntary, involuntary or also cardiac.

That All May Flourish Laura M. Hartman, 2018

Can humans flourish without destroying the earth In this book experts on many of the world's major and minor religious traditions address the question of human and earth flourishing Each chapter considers specific religious ideas and specific environmental harms Chapters are paired and the authors work in dialogue with one another Taken together the chapters reveal that the question of flourishing is deceptively simple Most would agree that humans should flourish without destroying the earth But not all humans have equal opportunities to flourish Additionally on a basic physical level any human flourishing must of necessity cause some harm These considerations of the price and distribution of flourishing raise unique questions about the status of humans and nature This book represents a step toward reconciliation that people and their ecosystems may live in peace that people from different religious worldviews may engage in productive dialogue in short that all may flourish
