Factory Physics Wallace J. Hopp, Mark L. Spearman, 2011-08-31 Our economy and future way of life depend on how well American manufacturing managers adapt to the dynamic globally competitive landscape and evolve their firms to keep pace. A major challenge is how to structure the firm's environment so that it attains the speed and low cost of high volume flow lines while retaining the flexibility and customization potential of a low volume job shop. The book's three parts are organized according to three categories of skills required by managers and engineers: basics, intuition, and synthesis. Part I reviews traditional operations management techniques and identifies the necessary components of the science of manufacturing. Part II presents the core concepts of the book, beginning with the structure of the science of manufacturing and a discussion of the systems approach to problem solving. Other topics include behavioral tendencies of manufacturing plants, push and pull production systems, the human element in operations management, and the relationship between quality and operations. Chapter conclusions include main points and observations framed as manufacturing laws. In Part III, the lessons of Part I and the laws of Part II are applied to address specific manufacturing management issues in detail. The authors compare and contrast common problems, including shop floor control, long range aggregate planning, workforce planning, and capacity management. A main focus in Part III is to help readers visualize how general concepts in Part II can be applied to specific problems. Written for both engineering and management students, the authors demonstrate the effectiveness of a rule-based and data-driven approach to operations planning and control. They advance an organized framework from which to evaluate management practices and develop useful intuition about manufacturing systems. *Springer Handbook of Mechanical Engineering*

Experiencing Archaeology by Experiment Penny Cunningham, Julia Heeb, Roeland Paardekooper, 2008 There is a growing trend among archaeologists to re create artefacts and actions at a 1:1 scale in order to answer questions and gain new insights into the past In November 2007 the University of Exeter hosted a one day conference on experimental archaeology and it was soon discovered that experience is a key issue in understanding the use of materials and past processes Papers presented in this volume consider both theoretical issues and practical case studies The scope ranges from skinning animals or dyeing wool the Roman way to producing sound with flint tools carving stone on Chalcolithic Cyprus or casting bronze objects both as art and science in Ireland The eight chapters in this book demonstrate the myriad possibilities of archaeology by experiment Experimental archaeology is multi disciplinary by nature with examples from anthropology ethnography taxidermy finite element analysis and manufacturing systems theory all being present in this volume Not only does this sub discipline have a colourful and meaningful past but it will surely have a significant future
