

LAB _____ STAGES OF THE HUMAN MENSTRUAL CYCLE

When a human female is born, her ovaries already contain all the immature eggs that will later mature and produce functional eggs during her lifetime. Eggs usually begin to mature between the ages of 12 and 14, when a release of hormones triggers puberty, and a young woman reaches sexual maturity. Most commonly, eggs mature every 28 days or so. They usually mature one at a time, in alternating ovaries. This rhythmic maturation of eggs and the other chemical and physical events that accompany the process are called the menstrual cycle.

As a reaction to increasing levels of the hormone FSH (follicle stimulating hormone), eggs start to mature in a woman's ovary. Each egg matures inside an egg sac, or follicle, near the surface of one of the ovaries. When the egg is fully mature, another hormone — LH (luteinizing hormone) — reaches peak level. As a reaction to these high hormone levels, the follicle bursts open and releases the egg. This process is called ovulation. Tiny microscopic hairs, called cilia, on the cells at the opening to the fallopian tube or oviduct, sweep the egg into the tube which leads to the uterus.

As a reaction to increasing levels of the hormone estrogen, the lining of the uterus has been prepared to receive a fertilized egg by building up its lining with nurturing tissues and blood vessels.

After the egg is released from the follicle in the ovary, the remaining follicle tissue becomes a hormone-secreting gland, the corpus luteum ("yellow body"). The gland releases the hormone progesterone. High levels of progesterone help maintain the uterine in its built up, nurturing phase.

If the released egg remains unfertilized, it does not implant in the uterus lining. This triggers further hormonal changes. Both estrogen levels and progesterone levels drop. This causes the lining of the uterus to deteriorate. As a result both unfertilized egg and uterus lining are shed and pass out of the body. This periodic loss of tissues and fluids from the uterus is a normal function known as menstruation (a period). Menstruation is considered the beginning of the monthly menstrual cycle.

All of these changes are governed by coordinated hormones carried in the bloodstream from their releasing gland to their responding target cells. These hormones act through feedback mechanisms. The pituitary gland, at the base of the brain, secretes the two hormones that trigger the growth and development of the egg in the ovary — FSH (follicle stimulating hormone) and LH (luteinizing hormone). In response, the ovary then secretes the two sex hormones that control development of the egg and uterus lining — estrogen and progesterone. When ovarian hormones reach low levels, this "feeds back" and stimulates the pituitary gland to once again secrete its hormones to stimulate the development of another egg for another cycle.

Estrogens and Antiestrogens II Michael Oettel, Ekkehard Schillinger, 2012-12-06 For many years Springer has been publishing an impressive series of textbooks of pharmacology which have set standards in medical science Surprisingly an extensive overview of the current state of the art in research on estrogens and anti estrogens was still lacking The present two volumes on estrogens and anti estrogens provide a comprehensive review of a field of research in

which remarkable progress has been made over the past few years New insights into the mechanisms of steroid hormone action resulted in a tremendous number of publications from which new principles of preventive and therapeutic applications of estrogens and anti estrogens emerged Although various electronic data bases provide easy access to this copious information there was a clear necessity for a monograph style textbook which assesses and summarizes current knowledge in this rapidly expanding field of research It should be noted however that due to this dynamic development it is barely possible to comprehensively update every aspect of basic and clinical knowledge on estrogens and antiestrogens Thus the intention of the editors was to provide the reader with an overview of the classic and most recently explored areas of research and stimulate future interests in basic and applied endocrinology Estrogens were among the first steroid hormones described in the scientific literature Since they were first isolated since the chemical synthesis and pharmacological characterization of naturally occurring estrogens and later on of orally active derivatives estrogen research has produced continuously landmark results in reproductive endocrinology worldwide Department of Health and Human Services United States.
