 - Mechanical disadvantage: When a lever's load arm is longer than its effort arm, it is said to be at a mechanical disadvantage. It has a low load force to effort ratio.
5. Differentiate between a lever designed for speed versus power.
 - The speed lever (third-class) is the most common type of lever system in the body. Applied force is located between the load and the fulcrum
 - The power lever (second class) Load lies between the applied force and the fulcrum

 - Second class lever; function: the load is in the middle between the fulcrum and the effort. example: standing on tip toes
 - Third class lever: differs from the second-class lever in that the distribution of forces is changed in relation to the fulcrum. Example: elbow joint
