1. A surveyor needs to determine the distance between two points (A and B) that are on opposite sides of a river. He measures 300 yards along one bank (from A to C). The angles from each end of this line segment to the point across the river measure  $62^\circ$  (from point A) and  $53^\circ$  (from point C). Find the distance between A and B to the nearest yard.
2. A pier extending from the shore forms an  $85^\circ$  angle with the shore. Along the shore, at a distance of 100 feet from the beginning of the pier, the line of sight to the pier's tip measures  $37^\circ$ . Find the length of the pier to the nearest foot.
3. In the shot-put competition, the shot is tossed from the shot-put ring (Point A) and lands at Point B. Using modern electronic equipment, the distance of the toss can be measured without measuring tapes. A device located in the officials' booth above the ring (Point C) receives a signal when the shot lands and measures angles C and B. At a track meet, the officials' booth is 560 feet away from the ring. If angle B is  $85.3^\circ$  and angle C is  $5.7^\circ$ , determine the length of the toss to the nearest foot.
4. A pine tree growing on a hillside forms a  $75^\circ$  angle with the hill. (Note: Despite being on a steep hill, the tree will still grow vertically.) From a point 80 feet up the hill, the angle of elevation to the top of the tree is  $62^\circ$  and the angle of depression to the base of the tree is  $23^\circ$ . Find the height of the tree to the nearest foot.
