

Muscles

You run. You walk. You lift. You jump. You bend and stretch. How can you make these movements and many others? If you said by using your muscles, then you are correct. A **muscle** helps produce movement in your body and maintains the position of different parts of your body.

The human body contains over 600 muscles. The muscles are located under the skin and cover the bones. They do everything from pumping blood throughout the body to help you lift things as light as a feather or as heavy as a desk. You can control some of your muscles, but others, like the heart muscle, do their jobs without you having to think about them.

All muscles are made of the same material, a type of elastic tissue that works like a rubber band. (They are not made of rubber.) There are thousands and thousands of these small fibers that make up every muscle in the human body. They are long, thin cells that are grouped into bundles.

All muscles work by receiving a signal from a nerve; proteins and chemicals then release energy resulting in the muscle's **contraction**. This means the muscle pulls the bones it's connected to closer together. At the same time, other muscles may expand or **relax**, allowing muscle pairs to work together and help you move back and forth.

This is how the biceps and triceps in your arms work. When the biceps contract, the triceps will relax, allowing your arm to bend. When straightening the arm again, the opposite takes place; the biceps will relax and the triceps will contract. The muscles are working together by **relaxing and contracting**.
