

Genetic Mutations

What mistakes can occur when DNA is replicated?

Why?

The genes encoded in your DNA result in the production of proteins that perform specific functions within your cells. Various environmental factors and spontaneous events can lead to changes in genes. These changes, called **mutations**, can lead to alterations in the structure and activity of the proteins your cells use in their daily activities. In other words, changes to your genotype can result in changes to your phenotype. We all have mutations in most of our body cells—yet we are, for the most part, normal and functional human beings. How can that be?

Mutation research Charlotte Auerbach, 1976-01-01 This book is intended for the senior undergraduate Honours student in genetics and for the postgraduate who wants a survey of the whole field or information on a special area within it In order to cater for readers with such different requirements I have made the list of references unusually large for a textbook It includes classical papers as well as very recent ones to the end of 1974 reviews as well as specialized articles elementary expositions from Scientific American as well as highly technical papers from journals on genetics and molecular biology In areas of active research I have given preference to the latest references which will lead the reader to earlier ones In addition to the references at the end of each chapter a bibliography at the end of the book lists relevant books and general reviews Apart from the first chapter the book is not written as a history of mutation research but throughout I have tried to emphasize the continuity of the problems concepts and ideas The reader will find many examples of this Muller's once famous and then almost forgotten classification of genes by their action has now been given biochemical reality by studies of
