Scientific and Technical Aerospace Reports, 1995 Simulators in Anesthesiology Education Lindsey C. Henson, Andrew C. Lee, 2013-06-29 In the past ten years full scale simulation training has become dramatically more evident in undergraduate and graduate medical education This increase has been due primarily to two factors the development of new computer driven technology and an interest in simulation specific training techniques Technologically simulators have evolved from simple anatomical reproductions to full scale accurate reproductions of anatomy and physiology powered by multiple computers High technology simulation centers run by teams of faculty are emerging as integral tools in fulfilling medical centers educational missions In addition educational techniques specific to simulation which have been developed and used by other industries for over half a century are being applied to medical training Aviation and aerospace have used sophisticated simulation since the 1950s to train pilots and astronauts Extrapolating these methods for use in the medical world has been a natural course of events particularly in specialties that require some of the same basic thought processes and interactions required of the pilot or astronaut It is not surprising then that anesthesiology would be the medical specialty to take the lead in adding simulation training to its educational programs The anesthesiologist's job in the operating room is similar to that of a pilot in a cockpit not in the specific tasks but in decision making technological and human interfaces and crisis management

Foundations of Information and Software Science Jagdish C. Agrawal, 2012-12-06 The purpose of the Second Symposium

on Empirical Foundations of Information and Software Science EFISS was in essence the same as that of the First Symposium in this series i.e. to explore subjects and methods of scientific inquiry which are of fundamental and common interest to information and software sciences and to map directions of research that will benefit from the mutual interaction of these two fields. In fact one of the most important results of the First EFISS Symposium was the conclusion that the commonality of these two sciences is much more than just the commonality of their objects of study namely the study of informative and prescriptive properties of texts in all kinds of sign systems such as natural or artificial languages. Rather the most challenging problems appear to be in the areas in which both these sciences overlap such as for instance the problem of trade offs between informative and prescriptive uses of texts. This problem can be formulated in generic terms as follows: given a certain kind of action or activity which has been prescribed to some agent i.e. which is required to be implemented or carried out, what kind of information should be provided to the agent in what form and how should it be distributed over the contextual structure of the prescriptive text to enable the agent to carry out the action or activity most effectively and efficiently.
