Solubility Phenomena in The Context of Nuclear Waste Disposal Xavier Gaona, Sarah Saslow, Hye-Ryun Cho, Taishi Kobayashi, Bernd Grambow, 2023-12-13 Safety concepts regarding nuclear waste

disposal in underground repositories generally rely on a combination of engineered and geological barriers that minimize potential radionuclide release out of the containment providing rock zone and transport through the biosphere. The presence of water however may alter the engineered barrier system dissolve radionuclides and facilitate radionuclide transport that over time may permeate the biosphere. So while barrier systems aim to prevent or hinder water from contacting the waste the possible intrusion of aqueous solutions must be considered for several safety case scenarios impacted by the long term evolution of a repository. Dissolution and solubility phenomena thus arise as important processes controlling the chemical behaviour of radionuclides and other key materials of relevance in the context of such repositories and their safety assessments. The solubility and aqueous speciation of radionuclides is of particular interest as they provide upper limits of water transportable concentrations of radionuclides. Solubility phenomena of radioactive and other gases in water provide important information on gas transport and pressure build up. Moreover solubility assessments offer insight into time independent constraints on the evolution of the disposal system. Particularly important in this regard is the geochemical modelling of radionuclide behaviour in the engineered barrier system as well as in natural aquatic systems along the transport path of radionuclides to the biosphere. The obtained information provides valuable inputs that appropriately constrain safety analyses of nuclear waste disposal.

Intracellular Calcium Anthony K. Campbell, 2014-10-14. Thousands of imaginative scientists over more than a century have revealed the fascinating story of intracellular calcium through a pathway of ingenious invention and discovery. *Intracellular Calcium* the definitive book on this topic reveals the pathway of discovery and invention of intracellular calcium over more than 100 years. The evidence for intracellular calcium as a universal switch in all animal, plant, fungal and microbial cells. How the components required for calcium signalling are named and classified. The ingenious technology which has been developed to study intracellular calcium. How calcium is regulated inside cells and how it works to trigger an event. The role of intracellular calcium in disease, cell injury and cell death. How many drugs work through the calcium signalling system. How intracellular calcium is involved in the action of many natural toxins. How the intracellular calcium signalling system has evolved over 4000 million years showing why it was crucial to the origin of life. A key principle presented throughout the book is the molecular variation upon which the intracellular calcium signalling system depends. This variation occurs within the same cell type and between cells with different functions providing the invisible matrix upon which Darwin and Wallace's Natural Selection depends. Featuring more

than 100 figures including detailed chemical structures as well as pictures of key pioneers in the field a bibliography of more than 1500 references as well as detailed subject and organism indices this definitive work provides a unique source of scholarship for teachers and researchers in the biomedical sciences and beyond
