I. INTRODUCTION

Background:

The Norway rat, *Rattus norvegicus*, belongs to the family Muridae, a large group of rodents that includes the house mouse, gerbil, and hamster. The rat is believed to have originated in Asia and migrated to Europe in the mid-1550s. During the fourteenth century it is estimated that almost half of the population of continental Europe was killed as a result of the "Black Death," or bubonic plague that is carried by rats. Rats are thought to have migrated to North America in the late 1700s after stowing away on ships. In addition to disease, the rat also wreaks havoc on farmer's crops, attacking small animals, etc.

Rats can be beneficial as well. They have allowed for important scientific discoveries in the laboratory environment in the areas of AIDS, cancer, and brain research. They are a valuable research and diagnostic tool due to their anatomical and physiological similarities to the human, high reproductive rate, and ease of maintenance.

Rats and humans belong to Domain Eukarya, Kingdom Animalia, Phylum Chordata, Subphylum Vertebrata, and Class Mammalia. The two primary mammalian characteristics that distinguish them from other vertebrates such as fish, amphibians, birds, and reptiles, is that their skin is covered with hair or fur and they have milk producing mammary glands in the female to nurse the young. Below is the entire classification of the white laboratory rat (a variety of the Norway rat) and humans.

White Rat

Domain—Eukarya
Kingdom—Animalia
Phylum—Chordata
Subphylum—Vertebrata
Class—Mammalia
Order—Rodentia
Family—Muridae
Genus—*Rattus*
Species—*norvegicus*
Variety—*albinus*

Human

Domain—Eukarya
Kingdom—Animalia
Phylum—Chordata
Subphylum—Vertebrata
Class—Mammalia
Order—Primates
Family—Hominidae
Genus—*Homo*
Species—*sapiens*

As you can see, rats and humans are similar through Class Mammalia, it is at the Order level where they differ. It is thought that there are probably more species of rodents today than all other mammals combined.

Rats typically begin to breed at 3 months of age and can produce a litter of about 8 young every 21-25 days. The average lab rat's lifespan is about 36 months, whereas rats in the wild typically live about 12-18 months.

Anatomical Terminology

There are many anatomical terms used when referring to organisms. The terms used in this laboratory are for quadrupeds, or four-legged animals like rats, therefore, not all terms are used for bipeds, or two-legged animals such as humans.

Directional Terms:

- Cranial/anterior—toward the head
- Caudal/posterior—toward the tail
- Dorsal—toward the backbone
- Ventral—toward the belly

Planes of Sections:

- Transverse (Cross section)—perpendicular to the long axis of the body
- Sagittal—divides body into right and left halves
- Frontal—divides the body into dorsal and ventral parts

Anderson,John D. Ash,Matthew M. LaVail,Joe G. Hollyfield,2019-12-28 This book contains the proceedings of the XVIII International Symposium on Retinal Degeneration RD2018 A majority of those who spoke and presented posters at the meeting contributed to this volume The blinding diseases of inherited retinal degenerations have no treatments and age related macular degeneration has no cures despite the fact that it is an epidemic among the elderly with 1 in 34 affected by the age of 70 The RD Symposium focused on the exciting new developments aimed at understanding these diseases and providing therapies for them Since most major scientists in the field of retinal degenerations attend the biennial RD Symposia they are known by most as the best and most important meetings in the field

The volume presents representative state of the art research in almost all areas of retinal degenerations ranging from cytopathologic physiologic diagnostic and clinical aspects animal models mechanisms of cell death candidate genes cloning mapping and other aspects of molecular genetics and developing potential therapeutic measures such as gene therapy and neuroprotective agents for potential pharmaceutical therapy While advances in these areas of retinal degenerations were described there will be many new topics that either are in their infancy or did not exist at the time of the last RD Symposium RD2016 These include the role of inflammation and immunity as well as other basic mechanisms in age related macular degeneration several new aspects of gene therapy and revolutionary new imaging and functional testing that will have a huge impact on the diagnosis and following the course of retinal degenerations as well as to provide new quantitative endpoints for clinical trials The retina is an approachable part of the central nervous system CNS and there is a major interest in neuroprotective and gene therapy for CNS diseases and neurodegenerations in general It should be noted that with successful and exciting initial clinical trials in neuroprotective and gene therapy including the restoration of sight in blind children the retinal degeneration therapies are leading the way towards new therapeutic measures for neurodegenerations of the CNS Many of the successes recently reported in these areas of retinal degeneration sprang from collaborations established at previous RD Symposia and many of those were reported at the RD2016 meeting and included in the current volume We anticipate the excitement of those working in the field and those afflicted with retinal degenerations is reflected in the volume
