The core of this book is a series of discovery projects using minimal resources to explore the use of light in the theatre with particular emphasis on the interaction of conflicting visual aims. The projects cover all the major scenarios likely to be encountered by lighting students and have been tried and tested by the author who has taught lighting students all over the world for over 30 years. The book has been updated to include more on safety and the latest technology including fixed instruments using the new lower wattage high efficiency lamps in combination with dichronic reflectors, an increase in the availability, reliability, range and usage of moving light technology based on remotely controlled instruments. New lighting projects have also been added. If you are studying the art and craft of stage lighting, this book is an excellent working manual that will provide you with the technical knowledge and skill to cope with a range of lighting situations.

Stage Lighting Installations Timothy James Barton, 1979 **Stage Lighting** Richard E. Dunham, 2015-10-30

The book's organization follows a layered approach that builds on basic principles. Light as a Medium. Part 1: Tools of a Lighting Designer. Part 2: Design Fundamentals. Part 3 and Lighting Applications. Part 4: This presents students with a practical and logical sequence when learning basic concepts. The full spectrum of the lighting design process is presented in detail, giving students an example of how one might develop a lighting design from script analysis through concept and plot development and all the way to an opening. This detailed process with a step by step design approach gives students a plan to work from which they can later modify as they mature and gain confidence as designers. The text contains a more comprehensive discussion of basic technology, light as a physical phenomena and methodology of designs than is found in most introductory texts, bridging the gap between introductory and advanced lighting courses. The text will appeal to theatrical designers who want to venture into areas of lighting like architectural or virtual lighting design while at the same time gaining a solid grounding in the fundamentals of lighting design. Lighting Design will also benefit illuminating engineers who want to move away from mere computational approaches in lighting and on to explore techniques along the design approaches of theatrical lighting design. The final 9 chapters cover many specialty areas of lighting design, highlighting the unique and shared qualities that exist between the different aspects of these elements. Discussions involve traditional entertainment areas like theatre as well as lesser known facets of the industry including film, video, landscape lighting, retail, museum lighting, virtual lighting, concert, spectacle performances and architectural lighting. Models of design tasks demonstrate the actual use and development of plots, sections, schedules, photometrics tables and cut sheets rather than simply talking about what they are. This hands on approach provides students with a firm understanding of how to actually use these tools and processes.
