Techniques to Quantify Phenotypes in Biological Treatment Process K. G. Robinson, 2004-01-01 This research attempts to evaluate nitrification treatment performance in combined carbon nitrogen municipal wastewater reactors using traditional physical chemical methods and modern molecular techniques Bench scale activated sludge reactors were operated at different SRTs under varying DO levels and temperatures over a 21 month period Real time PCR assays were used to determine cell concentrations of total bacterial 16S rDNA a gross measure of biomass content the amoA gene a measure of ammonia oxidizing bacteria AOB and the Nitrospira 16S rDNA gene a measure of nitrite oxidizing bacteria NOB As expected gravimetric biomass and total bacterial 16S rDNA levels increased with increasing SRT Ammonia oxidation rates and N oligotropha type AOB concentrations did not follow similar trends with respect to changes in SRT temperature and DO nor were they highly correlated The concentration of available nitrite and SRT were positively correlated with Nitrospira cell densities while DO concentration and temperature were negatively correlated with NOB levels The percentage of the total population comprised of AOB and NOB obtained with the real time PCR assays were compared to predicted values estimated from design equations using typical kinetic parameters While the percentages of NOB measured using the real time PCR assay corresponded very well with the predicted values the measured percentages of AOB were much lower than those estimated from the design equations suggesting that N oligotropha type AOB were not the dominant ammonia oxidizing species in these reactors This publication can be purchased and downloaded via Pay Per View on Water Intelligence Online click on the Pay Per View icon below *Plant Natural Products for Human Health* Chun-Tao Che, Hongjie Zhang, 2019-03-21 Plants have served mankind as an important source of foods and medicines While we all consume plants and their products for nutritional support a majority of the world population also rely on botanical remedies to meet their health needs either as their own traditional medicine or as complementary and alternative medicine From a pharmaceutical point of view many compounds obtained from plant sources have long been known to possess bio pharmacological activities and historically plants have yielded many important drugs for human use from morphine discovered in the early nineteenth century to the more recent paclitaxel and artemisinin Today we are witnessing a global resurgence in interest and use of plant based

therapies and botanical products and natural products remain an important and viable source of lead compounds in many drug discovery programs This Special Issue on Plant Natural Products for Human Health compiles a series of scientific reports to demonstrate the medicinal potentials of plant natural products It covers a range of disease targets such as diabetes inflammation cancer neurological disease cardiovascular disease liver damage bacterial and fungus infection and malarial These papers provide important insights into the current state of research on drug discovery and new techniques It is hoped that this Special Issue will serve as a timely reference for researchers and scholars who are interested in the discovery of potentially useful molecules from plant sources for health related applications **Principles of Molecular**
