Holt Environmental Science Modeling Water Budgets:

Environmental Tracking for Public Health Surveillance Stanley A. Morain, Amelia M. Budge, 2012-09-25 Satellite imagery and data are widely used in public health surveillance to provide early warning of disease outbreaks and for averting pandemics. Convergence of these technologies began in the 1970s and has gained wide acceptance in the 21st Century. Environmental Tracking for Public Health Surveillance focuses on the expanding use of satellite sensor imagery and long term spectral measurements for assessing and modelling Earth's environments in context of public health surveillance. It addresses vector borne, air borne, water borne and zoonotic diseases and explores analytical methods for forecasting environmental conditions and their potential for consequent disease outbreaks. Infectious and contagious diseases are of particular interest in this volume because once parasite vector human host pathways are triggered by favourable biological circumstances, pandemic diseases can spread to global scale in a matter of hours. The chapters advance readers through three sets of material. Part I reviews the 1970-2012 history of satellite Earth science surveillance technology that led to linking natural environments to human diseases and more generally to public health applications. Part II describes specific infectious and contagious diseases and the threat of emerging and re-emerging diseases. Part III explores the kinds of satellite data modelling and electronic information systems being developed to expedite health intercessions and responses at local to regional and global scales of reference. Equally important are the extensive reference sections for chapters in Parts II and III. For readers interested in tracking the development of Earth science technology, these constitute a thorough entry to both the health and environmental literature. The chapters are written jointly by experts in both the health and Earth science technologies. Each chapter is accompanied by an extensive list of citations to provide background and validation of the current state of the art for a variety of high interest human diseases and associated health and well being issues. The importance of day to day weather patterns, the impacts of severe weather events and longer term climate cycles form the basis for developing information systems that meet goals and expectations of national and international health monitoring bodies. Environmental Tracking for Public Health Surveillance provides a state of the art overview on how environmental tracking data from satellite, airborne and ground based sensors are being integrated into appropriate geophysical and spatial information system models to enhance public health surveillance and decision making from local to global levels and is intended primarily for a cross disciplinary professional audience consisting of public health decision makers, spatial data analysts, modelers, Earth observation specialists and medical researchers.

The Coastal Everglades Daniel L. Childers, Evelyn Gaiser, Laura A. Ogden, 2019-09-25 The Coastal Everglades presents a broad overview and synthesis of research on the coastal Everglades, a region that includes Everglades National Park, adjacent managed wetlands and agricultural and urbanizing communities. Contributors for this volume are all collaborators on the Florida Coastal Everglades Long Term Ecological Research Program (FCE LTER). The FCE LTER began in 2000 with a focus on understanding key

ecosystem processes in the coastal Everglades while also developing a platform for and linkages to related work conducted by an active and diverse Everglades research community The program is based at Florida International University in Miami but includes scientists and students from numerous other universities as well as staff scientists at key resource management agencies including Everglades National Park and the South Florida Water Management District Though the Everglades landscape spans nearly a third of the State of Florida the focus on the coastal Everglades has allowed the contributors to examine key questions in social ecological science in the context of ongoing restoration initiatives As this book demonstrates the long term research of the FCE LTER has facilitated a better understanding of the roles of sea level rise water management practices urban and agricultural development and other disturbances such as fires and storms on the past and future dynamics of this unique coastal environment By comparing properties of the Everglades with other subtropical and tropical wetlands the book challenges ideas of novelty while revealing properties of ecosystems at the ends of gradients that are often ignored It also provides insights from and encouragement for long term collaborative studies that inform resource management in similarly threatened coastal wetland landscapes

Laura A. Sacks, Amy Swancar, Terrie Mackin Lee, 1998 *Stochastic Water Demand Modelling* Mirjam Blokker, 2011-09-19 Water quality processes in the drinking water distribution network are strongly influenced by the flow velocity and residence time of the water in the network In order to understand how the water quality changes in the drinking water distribution network a good understanding of hydraulics is required Specifically in the periphery of the network where customers are connected the hydraulics can change rapidly During the night time the water is almost stagnant and the residence time increases In the morning when everybody gets up and flushes the toilet and takes a shower high flow velocities can occur During the remainder of the day flow velocities are

low The stochastic endues model SIMDEUM was developed to simulate water use on a small time scale 1 s and small spatial scale per fixture SIMDEUM enables a good model of flow velocities residence times and the connected water quality processes in the water distribution network Stochastic Water Demand Modelling Hydraulics in Water Distribution Networks describes the requirements of hydraulics in water quality modelling and provides insight into the development of detailed residential and non residential water demand models The book illustrates the use of detailed demand models in water quality models with respect to the variation in residence times and the relation with particle accumulation and resuspension The models are compared to measurements in several real drinking water distribution networks **Subterranean Estuaries**

Carlos Rocha, Henry Bokuniewicz, Clare Robinson, Isaac R. Santos, Hannelore Waska, 2023-01-19 Over recent decades it has become widely recognized that water exchange between coastal aquifers and the ocean is an important component of the hydrologic cycle Twenty years have passed since Willard S Moore Moore 1999 introduced the term subterranean estuary STE to identify those zones within coastal aquifers where fresh groundwater mixes with surface saltwater Like open water estuaries STEs regulate the transfer of chemicals to the sea under the seashore by submarine groundwater discharge SGD This subterranean reactive node in the land ocean exchange pathway has a physical even if elusive structure created by a combination of temporally and spatially variable mass transfer across the groundwater ocean interface and dynamic flow processes Many case studies have shown that SGD is a key material link between coastal watersheds and the sea and indeed spatially resolved budgets of radioactive tracers in shelf waters suggest it is the dominant bulk water flux to coastal zones globally Clearly STE outflow as SGD is a large source of biogeochemically active solutes to shelf seas meaning that elemental budgets for these waters have to be revised in order to account for the new input But how Recognizing the global prevalence and potential environmental and societal impact of SGD numerous attempts to quantify chemical inputs into the ocean through this pathway have been published over the past 40 years However the role of the STE in modulating chemical fluxes to coastal waters has been generally oversimplified making a comprehensive analysis of cause and effect relationships between SGD inputs and ecosystem dynamics merely indicative Unfortunately we still lack a mechanistic understanding of the processes that control the interaction between allochthonous chemical delivery and autochthonous recycling in the STE that drive compositional variability of SGD flows Like that applied to open water estuaries a general practical and theoretical framework is needed one that captures the structure and biogeochemistry of STEs and allows more accurate understanding of the chemical composition of SGD outflows while simultaneously providing for a typological basis that provides solid support for extrapolation of local SGD chemical flux measurements to regional and from these to global scale A comprehensive and critical review of the current state of the art would reveal that progress requires a improved variable density groundwater flow models that provide more accurate predictions and insights into the flow salt transport and mixing dynamics in STEs b quantitative understanding of the physicochemical and temporal drivers of saline groundwater seepage

and composition and a better knowledge of the microbial ecology of STEs and links to marine freshwater and terrestrial drivers of STE dynamics Significant research effort has been devoted to addressing these knowledge gaps It is now time to provide a focused synopsis of these efforts We propose a combination of cutting edge original research systematic practice and policy reviews methods and hypothesis and theory articles tied together by a direction setting perspective analysis to generate a comprehensive and accurate scientific foundation supporting environmental managers scientists and other stakeholders to assess SGD feedbacks on coastal ecosystem functioning and resilience and implement successful coastal management policies

Challenging Nature Philip W. Porter, 2006-03 Tanga Region Tanzania is an area of persistent rural poverty with a long history of drought floods food shortages famine and social and economic disruption Though farmers have been cultivating the land there for hundreds of years they have consistently been unable to supply adequate food for the region's inhabitants In *Challenging Nature* Philip Porter examines eighteen farming communities to understand what the farmers there know about their environment and which historical and economic factors play into the lack of food security Porter first began work on this project in 1972 asking 250 farmers in the region about life history environmental and agricultural changes types of crops grown and methods of planting environmental assessments agricultural practices food and water supplies training and education and attitudes toward nature Twenty years later he returned and reinterviewed as many farmers as could be found from the first survey The result contextualizes the environmental history of the region while informing current and future agricultural development
