Complex Analysis D.H. Luecking, L.A. Rubel, 2012-12-06 The main idea of this book is to present a good portion of the standard material on functions of a complex variable as well as some new material from the point of view of functional analysis The main object of study is the algebra $H(G)$ of all holomorphic functions on the open set G with the topology on $H(G)$ of uniform convergence on compact subsets of G From this point of view the main theorem of the theory is Theorem 9.5 which concretely identifies the dual of $H(G)$ with the space of germs of holomorphic functions on the complement of G From this result for example Runge's approximation theorem and the global Cauchy integral theorem follow in a few short steps Other consequences of this duality theorem are the Gergely interpolation theorem and the Mittag-Leffler Theorem The approach via duality is entirely consistent with Cauchy's approach to complex variables since curvilinear integrals are typical examples of linear functionals The prerequisite for the book is a one semester course in complex variables at the undergraduate graduate level so that the elements of the local theory are supposed known In particular the Cauchy Theorem for the square and the circle are assumed but not the global Cauchy Theorem in any of its forms The second author has three times taught a graduate course based on this material at the University of Illinois with good results

D'Angelo, 2017-08-02 Linear and Complex Analysis for Applications aims to unify various parts of mathematical analysis in an engaging manner and to provide a diverse and unusual collection of applications both to other fields of mathematics and to physics and engineering The book evolved from several of the author's teaching experiences his research in complex analysis in several variables and many conversations with friends and colleagues It has three primary goals to develop enough linear analysis and complex variable theory to prepare students in engineering or applied mathematics for advanced work to unify many distinct and seemingly isolated topics to show mathematics as both interesting and useful especially via the juxtaposition of examples and theorems The book realizes these goals by beginning with reviews of Linear Algebra Complex Numbers and topics from Calculus III As the topics are being reviewed new material is inserted to help the student develop skill in both computation and theory The material on linear algebra includes infinite dimensional examples arising from elementary calculus and differential equations Line and surface integrals are computed both in the language of classical vector analysis and by using differential forms Connections among

the topics and applications appear throughout the book The text weaves abstract mathematics routine computational problems and applications into a coherent whole whose unifying theme is linear systems It includes many unusual examples and contains more than 450 exercises *Lecture Notes on Complex Analysis* Ivan Francis Wilde, 2006 This book is based on lectures presented over many years to second and third year mathematics students in the Mathematics Departments at Bedford College London and King's College London as part of the BSc and MSci program Its aim is to provide a gentle yet rigorous first course on complex analysis Metric space aspects of the complex plane are discussed in detail making this text an excellent introduction to metric space theory The complex exponential and trigonometric functions are defined from first principles and great care is taken to derive their familiar properties In particular the appearance of i in this context is carefully explained The central results of the subject such as Cauchy's Theorem and its immediate corollaries as well as the theory of singularities and the Residue Theorem are carefully treated while avoiding overly complicated generality Throughout the theory is illustrated by examples A number of relevant results from real analysis are collected complete with proofs in an appendix The approach in this book attempts to soften the impact for the student who may feel less than completely comfortable with the logical but often overly concise presentation of mathematical analysis elsewhere

Introduction to Complex Analysis Junjiro Noguchi, 2008-04-09 This book describes a classical introductory part of complex analysis for university students in the sciences and engineering and could serve as a text or reference book It places emphasis on rigorous proofs presenting the subject as a fundamental mathematical theory The volume begins with a problem dealing with curves related to Cauchy's integral theorem To deal with it rigorously the author gives detailed descriptions of the homotopy of plane curves Since the residue theorem is important in both pure and applied mathematics the author gives a fairly detailed explanation of how to apply it to numerical calculations this should be sufficient for those who are studying complex analysis as a tool *Concise Complex Analysis* Sheng Gong, Youhong Gong, 2007 This is a concise textbook of complex analysis for undergraduate and graduate students Written from the viewpoint of modern mathematics the differential equation differential geometry Lie group etc it contains all the traditional material on complex analysis However many statements and proofs of classical theorems in complex analysis have been made simpler shorter and more elegant due to modern mathematical ideas and methods For example the Mittag-Leffler theorem is proved by the differential equation the Picard theorem is proved using the methods of differential geometry and so on BOOK JACKET
