

STAT 201 MIDTERM2 REVIEW

We can use Z scores to roughly identify which observations are more unusual than others. One observation X_1 is said to be more unusual than another observation X_2 if the absolute value of its Z score is larger than the absolute value of the other observation's Z score: $|Z_1| > |Z_2|$. This technique is especially insightful when a distribution is symmetric.

Simulating observations using a hypothesized null parameter value is often called a **parametric bootstrap simulation**.

The normal model poorly approximates the null distribution for $\hat{p}$ when the success-failure condition is not satisfied. As a substitute, we can generate the null distribution using simulated sample proportions and use this distribution to compute the tail area, i.e., the p-value.
