Abstract—Cloud service providers offer a trustworthy and resistant-based storage environment for on-demand cloud services to outsource clients' data. Several researchers and business entities currently adopt cloud services to store their data in remote cloud storage servers for cost-saving purposes. Cloud storage offers numerous advantages to users like scalability, low capital expenses, and data available from any place, anytime, regardless of location and device. However, as the users lose physical access and control over data, the storage service raises security and privacy issues, such as confidentiality, integrity, and availability of outsourced data. Data integrity is a primary concern for cloud users to confirm whether data integrity is intact or not. This paper presents a comprehensive review of cloud data auditing schemes and a comparative analysis of the desirable features. Furthermore, it provides advantages and disadvantages of the state-of-the-art techniques and a performance comparison regarding the communicational and computational costs of involved entities. It also highlights desirable features of different techniques, open issues, and future research trends of cloud data auditing protocols.

Keywords—Cloud computing; proof of possession; data integrity auditing; proof of retrievability; public auditing; proof of ownership

I. INTRODUCTION

Cloud computing is a new, rapidly emerging technology paradigm [1, 2], which can resolve large-scale service issues in multiple industries, such as engineering, sciences, and e-commerce [3]. Currently, several Cloud Service Providers (CSPs), for example, Linode [4], Amazon EC2 [5], Google Cloud Platform [6], and Microsoft Azure [7], manage and distribute shared resources for cloud users [8, 9]. Cloud computing offers manageable shared resources like services, networks, servers, applications, and storage that can be accessed over the Internet and managed with minimal effort without the interaction of cloud service providers [10, 11]. Generally, the distributed shared resources of the CSPs are available to their clients based on the pay-as-you-go. The CSPs mainly offer services like Platform-as-a-Service, Software-as-a-Service, and Infrastructure-as-a-Service [12, 13], as shown in Fig. 1. The web applications we used years ago, for instance, YouTube, Facebook, Instagram, and Twitter, are examples of cloud computing services. Furthermore, Dropbox, Amazon web services, and Google applications are generally utilized for

personal and business purposes to store and share information anywhere and anytime via the Internet.

The critical part of this business model is to outsource and share data for distributed computing. Cloud storage is an elastic on-demand service model that attains significant benefits; for example, it decreases storage administration burden and reduces infrastructure and software costs. Moreover, it helps to access data from various geographic locations, focusing on ease of maintenance, efficient computation [14], data storage, data archival disaster recovery, etc. [15]. Statista reported that the cloud computing business model persistently develops and is estimated to reach 379 billion US dollars by 2022, showing a tremendous increase in this service sector [16].

Even though the adoption and development of cloud computing businesses are growing every year, most corporations are not satisfied with using this business model due to some obstacles, like pricing, interoperability, vendor lock-in, reliability, and security [17]. Security is the most critical concern [17] because it can be compromised while transferring the data from one location to another by cloud administrators, dishonest CSPs, malware, or other malevolent users who can mutilate the data [18].
